# Extensions for Financial Services (XFS) interface specification Release 3.50 - Part 3: Printer and Scanning Device Class Interface - Programmer's Reference

This CEN Workshop Agreement has been drafted and approved by a Workshop of representatives of interested parties, the constitution of which is indicated in the foreword of this Workshop Agreement.

The formal process followed by the Workshop in the development of this Workshop Agreement has been endorsed by the National Members of CEN but neither the National Members of CEN nor the CEN-CENELEC Management Centre can be held accountable for the technical content of this CEN Workshop Agreement or possible conflicts with standards or legislation.

This CEN Workshop Agreement can in no way be held as being an official standard developed by CEN and its Members.

This CEN Workshop Agreement is publicly available as a reference document from the CEN Members National Standard Bodies.

CEN members are the national standards bodies of Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Republic of North Macedonia, Romania, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Türkiye and United Kingdom.

## **European Foreword**

This CEN Workshop Agreement has been developed in accordance with the CEN-CENELEC Guide 29 "CEN/CENELEC Workshop Agreements – The way to rapid consensus" and with the relevant provisions of CEN/CENELEC Internal Regulations - Part 2. It was approved by a Workshop of representatives of interested parties on 2022-11-08, the constitution of which was supported by CEN following several public calls for participation, the first of which was made on 1998-06-24. However, this CEN Workshop Agreement does not necessarily include all relevant stakeholders.

The final text of this CEN Workshop Agreement was provided to CEN for publication on 2022-11-18.

The following organizations and individuals developed and approved this CEN Workshop Agreement:

- AURIGA SPA
- CIMA SPA
- DIEBOLD NIXDORF SYSTEMS GMBH
- FIS BANKING SOLUTIONS UK LTD (OTS)
- FUJITSU TECHNOLOGY SOLUTIONS
- GLORY LTD
- GRG BANKING EQUIPMENT HK CO LTD
- HITACHI CHANNEL SOLUTIONS CORP
- HYOSUNG TNS INC
- JIANGSU GUOGUANG ELECTRONIC INFORMATION TECHNOLOGY
- KAL
- KEBA HANDOVER AUTOMATION GMBH
- NCR FSG
- NEXUS SOFTWARE
- OBERTHUR CASH PROTECTION
- OKI ELECTRIC INDUSTRY SHENZHEN
- SALZBURGER BANKEN SOFTWARE
- SECURE INNOVATION
- SIGMA SPA

It is possible that some elements of this CEN/CWA may be subject to patent rights. The CEN-CENELEC policy on patent rights is set out in CEN-CENELEC Guide 8 "Guidelines for Implementation of the Common IPR Policy on Patents (and other statutory intellectual property rights based on inventions)". CEN shall not be held responsible for identifying any or all such patent rights.

The Workshop participants have made every effort to ensure the reliability and accuracy of the technical and non-technical content of CWA 16926-03, but this does not guarantee, either explicitly or implicitly, its correctness. Users of CWA 16926-03 should be aware that neither the Workshop participants, nor CEN can be held liable for damages

#### CWA 16926-3:2022 (E)

or losses of any kind whatsoever which may arise from its application. Users of CWA 16926-03 do so on their own responsibility and at their own risk.

The CWA is published as a multi-part document, consisting of:

Part 1: Application Programming Interface (API) - Service Provider Interface (SPI) - Programmer's Reference

Part 2: Service Classes Definition - Programmer's Reference

Part 3: Printer and Scanning Device Class Interface - Programmer's Reference

Part 4: Identification Card Device Class Interface - Programmer's Reference

Part 5: Cash Dispenser Device Class Interface - Programmer's Reference

Part 6: PIN Keypad Device Class Interface - Programmer's Reference

Part 7: Check Reader/Scanner Device Class Interface - Programmer's Reference

Part 8: Depository Device Class Interface - Programmer's Reference

Part 9: Text Terminal Unit Device Class Interface - Programmer's Reference

Part 10: Sensors and Indicators Unit Device Class Interface - Programmer's Reference

Part 11: Vendor Dependent Mode Device Class Interface - Programmer's Reference

Part 12: Camera Device Class Interface - Programmer's Reference

Part 13: Alarm Device Class Interface - Programmer's Reference

Part 14: Card Embossing Unit Device Class Interface - Programmer's Reference

Part 15: Cash-In Module Device Class Interface - Programmer's Reference

Part 16: Card Dispenser Device Class Interface - Programmer's Reference

Part 17: Barcode Reader Device Class Interface - Programmer's Reference

Part 18: Item Processing Module Device Class Interface - Programmer's Reference

Part 19: Biometrics Device Class Interface - Programmer's Reference

Parts 20 - 28: Reserved for future use.

Parts 29 through 47 constitute an optional addendum to this CWA. They define the integration between the SNMP standard and the set of status and statistical information exported by the Service Providers.

Part 29: XFS MIB Architecture and SNMP Extensions - Programmer's Reference

Part 30: XFS MIB Device Specific Definitions - Printer Device Class

Part 31: XFS MIB Device Specific Definitions - Identification Card Device Class

Part 32: XFS MIB Device Specific Definitions - Cash Dispenser Device Class

Part 33: XFS MIB Device Specific Definitions - PIN Keypad Device Class

Part 34: XFS MIB Device Specific Definitions - Check Reader/Scanner Device Class

Part 35: XFS MIB Device Specific Definitions - Depository Device Class

Part 36: XFS MIB Device Specific Definitions - Text Terminal Unit Device Class

Part 37: XFS MIB Device Specific Definitions - Sensors and Indicators Unit Device Class

Part 38: XFS MIB Device Specific Definitions - Camera Device Class

Part 39: XFS MIB Device Specific Definitions - Alarm Device Class

Part 40: XFS MIB Device Specific Definitions - Card Embossing Unit Class

Part 41: XFS MIB Device Specific Definitions - Cash-In Module Device Class

Part 42: Reserved for future use.

Part 43: XFS MIB Device Specific Definitions - Vendor Dependent Mode Device Class

Part 44: XFS MIB Application Management

Part 45: XFS MIB Device Specific Definitions - Card Dispenser Device Class

Part 46: XFS MIB Device Specific Definitions - Barcode Reader Device Class

Part 47: XFS MIB Device Specific Definitions - Item Processing Module Device Class

Part 48: XFS MIB Device Specific Definitions - Biometrics Device Class

Parts 49 - 60 are reserved for future use.

Part 61: Application Programming Interface (API) - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Service Provider Interface (SPI) - Programmer's Reference

Part 62: Printer and Scanning Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 63: Identification Card Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 64: Cash Dispenser Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 65: PIN Keypad Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 66: Check Reader/Scanner Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 67: Depository Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 68: Text Terminal Unit Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 69: Sensors and Indicators Unit Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 70: Vendor Dependent Mode Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 71: Camera Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 72: Alarm Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 73: Card Embossing Unit Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 74: Cash-In Module Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 75: Card Dispenser Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 76: Barcode Reader Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 77: Item Processing Module Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

Part 78: Biometric Device Class Interface - Migration from Version 3.40 (CWA 16296:2020) to Version 3.50 (this CWA) - Programmer's Reference

In addition to these Programmer's Reference specifications, the reader of this CWA is also referred to a complementary document, called Release Notes. The Release Notes contain clarifications and explanations on the CWA specifications, which are not requiring functional changes. The current version of the Release Notes is available online from: <a href="https://www.cen.eu/work/Sectors/Digital society/Pages/WSXFS.aspx">https://www.cen.eu/work/Sectors/Digital society/Pages/WSXFS.aspx</a>.

The information in this document represents the Workshop's current views on the issues discussed as of the date of publication. It is provided for informational purposes only and is subject to change without notice. CEN makes no warranty, express or implied, with respect to this document.

## CWA 16926-3:2022 (E)

3.10	November 29, 2007	For a description of changes from version 3.00 to version 3.10 see the PTR 3.10 Migration document.
3.20	March 2, 2011	For a description of changes from version 3.10 to version 3.20 see the PTR 3.20 Migration document.
3.30	March 19, 2015	For a description of changes from version 3.20 to version 3.30 see the PTR 3.30 Migration document.
3.40	December 06, 2019	For a description of changes from version 3.30 to version 3.40 see the PTR 3.40 Migration document.
3.50	November 18, 2022	For a description of changes from version 3.40 to version 3.50 see the PTR 3.50 Migration document.

## 1. Introduction

## 1.1 Background to Release 3.50

The CEN/XFS Workshop aims to promote a clear and unambiguous specification defining a multi-vendor software interface to financial peripheral devices. The XFS (eXtensions for Financial Services) specifications are developed within the CEN (European Committee for Standardization/Information Society Standardization System) Workshop environment. CEN Workshops aim to arrive at a European consensus on an issue that can be published as a CEN Workshop Agreement (CWA).

The CEN/XFS Workshop encourages the participation of both banks and vendors in the deliberations required to create an industry standard. The CEN/XFS Workshop achieves its goals by focused sub-groups working electronically and meeting quarterly.

Release 3.50 of the XFS specification is based on a C API and is delivered with the continued promise for the protection of technical investment for existing applications. This release of the specification extends the functionality and capabilities of the existing devices covered by the specification:

- Addition of E2E security
- PIN Password Entry

## 1.2 XFS Service-Specific Programming

The service classes are defined by their service-specific commands and the associated data structures, error codes, messages, etc. These commands are used to request functions that are specific to one or more classes of Service Providers, but not all of them, and therefore are not included in the common API for basic or administration functions.

When a service-specific command is common among two or more classes of Service Providers, the syntax of the command is as similar as possible across all services, since a major objective of XFS is to standardize function codes and structures for the broadest variety of services. For example, using the **WFSExecute** function, the commands to read data from various services are as similar as possible to each other in their syntax and data structures.

In general, the specific command set for a service class is defined as a superset of the specific capabilities likely to be provided by the developers of the services of that class; thus any particular device will normally support only a subset of the defined command set.

There are three cases in which a Service Provider may receive a service-specific command that it does not support:

The requested capability is defined for the class of Service Providers by the XFS specification, the particular vendor implementation of that service does not support it, and the unsupported capability is *not* considered to be fundamental to the service. In this case, the Service Provider returns a successful completion, but does no operation. An example would be a request from an application to turn on a control indicator on a passbook printer; the Service Provider recognizes the command, but since the passbook printer it is managing does not include that indicator, the Service Provider does no operation and returns a successful completion to the application.

The requested capability is defined for the class of Service Providers by the XFS specification, the particular vendor implementation of that service does not support it, and the unsupported capability *is* considered to be fundamental to the service. In this case, a WFS\_ERR\_UNSUPP\_COMMAND error for Execute commands or WFS\_ERR\_UNSUPP\_CATEGORY error for Info commands is returned to the calling application. An example would be a request from an application to a cash dispenser to retract items where the dispenser hardware does not have that capability; the Service Provider recognizes the command but, since the cash dispenser it is managing is unable to fulfil the request, returns this error.

#### CWA 16926-3:2022 (E)

The requested capability is *not* defined for the class of Service Providers by the XFS specification. In this case, a WFS\_ERR\_INVALID\_COMMAND error for Execute commands or WFS\_ERR\_INVALID\_CATEGORY error for Info commands is returned to the calling application.

This design allows implementation of applications that can be used with a range of services that provide differing subsets of the functionalities that are defined for their service class. Applications may use the **WFSGetInfo** and **WFSAsyncGetInfo** commands to inquire about the capabilities of the service they are about to use, and modify their behavior accordingly, or they may use functions and then deal with error returns to make decisions as to how to use the service.

## 2. Banking Printers

This specification describes the functionality of the services provided by banking printers and scanning devices under XFS, focusing on the following areas:

- application programming for printing
- print document definition
- integration with the Windows architecture
- scanning images for devices such as check scanners

These descriptions include definitions of the service-specific commands that can be issued, using the WFSAsyncExecute, WFSExecute, WFSGetInfo and WFSAsyncGetInfo functions.

The requirements for printing in banking applications are significantly different from those of the conventional PC environment, and the XFS support delivers the foundation for financial application printing, including:

#### • Controlled access to shared printers

The banking printers can be shared between workstations and the XFS layer provides the ability for the application to manage ownership of a print device. This allows an application to identify the operator granted control of the printer, and to ensure that a teller printing multiple documents is not interrupted by work for other applications.

#### • Application controlled printing

In the banking environment, it is necessary for the application to receive positive feedback on the availability of print devices, and the success or failure of individual print operations. The XFS printer support provides a standard mechanism for application retrieval of this status information.

#### • Management of printing peripherals

Distributed banking networks require the ability to track the availability and failure of printing peripherals on a branch and system-wide basis. Through the XFS **WFSRegister** function monitoring programs can collect error alerts from the banking printers.

#### • Vendor independent API and document definition

All of the XFS peripheral implementations are designed around a standardized family of APIs to allow application code portability across vendor hardware platforms. With printers, it is also recognized that banks invest a significant amount of resource in the authoring of print documents. The XFS printer service class is implemented around a forms model which also standardizes the basic document definition. This extends the investment protection provided by XFS compliant systems to include this additional part of the application development.

#### • Windows printing integration

It is possible for a banking printer to offer printing capabilities that can be accessed by non-banking specific applications, such as general office productivity packages. This would not, for example, be true for a receipt printer, but it could be the case for a device with document printing capabilities. A vendor may choose an XFS implementation that allows both types of applications (XFS and Windows applications using the Windows printing subsystem) to share the printing devices. The vendor should specify any impact this approach has on XFS subsystem operation, such as error reporting.

Full implementation of the above features depends on the individual vendor-supplied Service Providers. This specification outlines the functionality and requirements for applications using the XFS printer and scanning services, and for the development of those services.

## 3. Banking Printer Types

The XFS printer service defines and supports five types of banking printers through a common interface:

#### • Receipt Printer

The receipt printer is used to print cut sheet documents. It may or may not require insert or eject operations, and often includes an operator identification device, e.g. Teller A and Teller B lights, for shared operation.

#### • Journal Printer

The journal is a continuous form device used to record a hardcopy audit trail of transactions, and for certain report printing requirements.

#### • Passbook Printer

The passbook device is physically and functionally the most complex printer. The XFS definition supports automatic positioning of the book, as well as read/write capability for an optional integrated magnetic stripe. The implementation also manages the book geometry - i.e. the margins and centerfolds - presenting the simplest possible application interface while delivering the full range of functionality.

Some passbook devices also support the dispensing of new passbooks from up to four passbook paper sources (upper, aux, aux2, lower). Some passbook devices may also be able to place a full passbook in a parking station, print the new passbook and return both to the customer. Passbooks can only be dispensed or moved from the parking station if there is no other media in the print position or in the entry/exit slot.

#### • Document Printer

Document printing is similar to receipt printing - a set of fields are positioned on one or more inserted sheets of paper - but the focus is on full-size forms. It should be noted that the XFS environment supports the printing of text and graphic fields from the application. The electronic printing of the form image (the template portion of the form which is usually pre-printed with dot-matrix style printers) may also be printed by the application.

#### • Scanner Printer

The scanner printer is a device incorporating both the capabilities to scan inserted documents and optionally to print on them. These devices may have more than one area where documents may be retained.

Additional hardware components, like scanners, stripe readers, OCR readers, and stamps, normally attached directly to the printer are also controlled through this interface. Additionally the Printer and Scanning class interface can also be used for devices that are capable of scanning without necessarily printing. This includes devices such as Check Scanners.

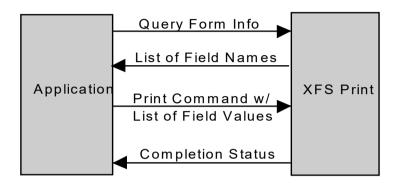

The specification refers to the terms paper and media. When the term paper is used this refers to paper that is situated in a paper supply attached to the device. The term media is used for media that is inserted by the customer (e.g. check and other material that is scanned) or that is issued to the customer (e.g. a receipt or statement). Receipt, document printers and also passbook printers with white passbook dispensing capability have both. As soon as the paper gets printed it becomes media. Scanners only have media. The term media does not apply to journal printers. When paper is in the print position it is classified as media, on some printers that maintain paper under the print head there will always be both media and paper.

## 4. Forms Model

The XFS printing class functionality is based on a "forms" model for printing. Banking documents are represented as a series of text and/or graphic fields output from the application, and positioned on the document by the XFS printing system.

The form is an object which includes the positioning and presentation information for each of the fields in the document. The application selects a form, and supplies only the field data and the control parameters to fully define the print document.

The form objects are owned and managed by the XFS printing service. To optimize maintainability of the system, the application can query the service for the list of fields required to print a given form. Through this mechanism, it is not necessary to duplicate the field contents of forms in application authoring data. The figure below outlines the printing process from the application's view.

The XFS implementation recognizes that the form object must be supported by job-specific data to fully address printing requirements. As an example, a form defining a passbook print line will need to have its origin defined externally in order to be reused for different passbook lines. These job specific parameters are supplied on the call to the **WFSExecute**: WFS\_CMD\_PTR\_PRINT\_FORM command.

In some cases, the application wants to print a block of data without considering it as a series of separate fields. One example is a line of journal data, fully formatted by the application. This can be handled by defining a one field form, or by use of the **WFSExecute**: WFS\_CMD\_PTR\_RAW\_DATA command.

The document definition under XFS printing is standardized to provide portability across vendor implementations. The standard has been defined at the source language level for the document definition, allowing vendor differences at the runtime level to manage implementation specific dependencies, providing several areas where vendors can provide value-added extensions. As an example, a vendor providing a graphical form definition tool can produce the field definition object format directly. The XFS requirements for portability are:

- A vendor must be able to export print format in the standardized field definition source format for portability to other systems.
- A vendor must be able to import document formats produced on other systems in the standardized field definition source format.
- A vendor can extend the field definition source language, but any verbs included in the standard must be implemented strictly as defined by the standard. Import and export facilities must be tolerant of source language extensions, reporting but ignoring the exceptions.

The document definition also recognizes that unique hardware restrictions may require tuning of field positioning from one vendor's platform to another. To enhance portability, the XFS document format has specifically been defined to allow a single reference adjustment for all fields to avoid forcing the customer to reposition each field.

## 6. Command Overview

The basic operation of the print devices is managed using the WFSGetInfo/WFSAsyncGetInfo and WFSExecute/WFSAsyncExecute functions, with two primary commands:

#### WFS INF PTR QUERY FORM

This command retrieves the form header information, and the list of fields. It is performed using **WFSGetInfo**, which means that it can be performed even when the service is locked by another user.

#### WFS CMD PTR PRINT FORM

This command is performed using **WFSExecute**, and includes as parameter data the name of the form to select and the required field data values.

This approach combines in the most efficient manner the four logical steps required to print a form:

- Selecting a document form object.
- Querying the service for the list of fields.
- Supplying the data for each field.
- Issuing the print command.

By using a **WFSGetInfo** command for retrieval of the list of field names, rather than **WFSExecute** (which is blocked when the service is locked by another application), it is possible for an application to assemble the required set of fields for a form before locking the service. This minimizes the time that each application request ties up the service. Using **WFSGetInfo**, it is also possible to query the attributes of a particular field. This command is generally not required for most applications.

The combination of form selection, field value presentation, and the print action into an atomic command - the WFSExecute: WFS\_CMD\_PTR\_PRINT\_FORM command - makes it possible to express a complete print operation with one API call. This implementation allows an application to perform a print operation without locking and subsequently unlocking the service (although locking may still be desirable for other reasons). To do multiple print operations without allowing other applications to intersperse their print requests, it is still necessary to use the lock functions. Where these multiple print functions represent a series of passbook lines (using the INDEX capability in the field definition), the WFSExecute: WFS\_CMD\_PTR\_PRINT\_FORM command provides support for management of the print line number. Note that if a form contains a tabular field (i.e. one with a non-zero INDEX value), and data is not supplied for some of the lines in the "table", then those lines are left blank.

For printers with the capability to read from a passbook (OCR, MICR and/or magnetic stripe), the data is read with the **WFSExecute**: WFS\_CMD\_PTR\_READ\_FORM command. The data is written using the **WFSExecute**: WFS\_CMD\_PTR\_PRINT\_FORM command. Since these devices are usable only for passbook operations, they are not defined as separate logical devices.

Finally, the **WFSExecute**: WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command can be used to print a file that contains a complete print job in the native printer language. This file will have been created through the Windows GDI.

## 7. Info Commands

## 7.1 WFS INF PTR STATUS

**Description** This command is used to request status information for the device.

Input Param None.

Output Param LPWFSPTRSTATUS lpStatus;

```
typedef struct _wfs_ptr_status
     WORD
                           fwDevice;
     WORD
                           fwMedia;
                           fwPaper[WFS PTR SUPPLYSIZE];
     WORD
     WORD
                          fwToner;
     WORD
                          fwInk;
                          fwLamp;
     WORD
     LPWFSPTRRETRACTBINS *lppRetractBins;
     USHORT
                           usMediaOnStacker;
     LPSTR
                          lpszExtra;
     DWORD
                          dwGuidLights[WFS PTR GUIDLIGHTS SIZE];
     WORD
                          wDevicePosition;
     USHORT
                          usPowerSaveRecoveryTime;
     WORD
                          wPaperType[WFS_PTR_SUPPLYSIZE];
     WORD
                          wAntiFraudModule;
     WORD
                          wBlackMarkMode;
     } WFSPTRSTATUS, *LPWFSPTRSTATUS;
```

#### *fwDevice*

Specifies the state of the print device as one of the following flags:

Value	Meaning
WFS_PTR_DEVONLINE	The device is online (i.e. powered on and operable).
WFS_PTR_DEVOFFLINE	The device is offline (e.g. the operator has taken the device offline by turning a switch).
WFS_PTR_DEVPOWEROFF	The device is powered off or physically not connected.
WFS_PTR_DEVNODEVICE	There is no device intended to be there; e.g. this type of self service machine does not contain such a device or it is internally not configured.
WFS_PTR_DEVHWERROR	The device is inoperable due to a hardware error.
WFS_PTR_DEVUSERERROR	The device is present but a person is preventing proper device operation.
WFS_PTR_DEVBUSY	The device is busy and unable to process an execute command at this time.
WFS_PTR_DEVFRAUDATTEMPT	The device is present but is inoperable because it has detected a fraud attempt.
WFS_PTR_DEVPOTENTIALFRAUD	The device has detected a potential fraud attempt and is capable of remaining in service. In this case the application should make the decision as to whether to take the device offline.

#### fwMedia

Specifies the state of the print media (i.e. receipt, statement, passbook, etc.) as one of the following values. This field does not apply to journal printers:

Value	Meaning
WFS_PTR_MEDIAPRESENT	Media is in the print position, on the stacker
	or on the transport (i.e. a passbook in the
	parking station is not considered to be
	present). On devices with continuous paper
	supplies, this value is set when paper is
	under the print head. On devices with no
	supply or individual sheet supplies, this
	value is set when paper/media is successfully
	inserted/loaded.
WFS_PTR_MEDIANOTPRESENT	Media is not in the print position or on the stacker.
WFS_PTR_MEDIAJAMMED	Media is jammed in the device.
WFS_PTR_MEDIANOTSUPP	The capability to report the state of the print media is not supported by the device.
WFS_PTR_MEDIAUNKNOWN	The state of the print media cannot be
	determined with the device in its current state.
WFS PTR MEDIAENTERING	Media is at the entry/exit slot of the device.
WFS PTR MEDIARETRACTED	Media was retracted during the reset
	operation.

## fwPaper [...]

Specifies the state of the paper supplies. A number of paper supplies are defined below. Vendor specific paper supplies are defined starting from the end of the array. The maximum paper index is WFS\_PTR\_SUPPLYMAX.

## fwPaper [WFS PTR SUPPLYUPPER]

Specifies the state of the only paper supply or the upper paper supply, if more than one, as one of the following values:

Value	Meaning
WFS_PTR_PAPERFULL	The paper supply is full.
WFS_PTR_PAPERLOW	The paper supply is low.
WFS_PTR_PAPEROUT	The paper supply is empty.
WFS_PTR_PAPERNOTSUPP	Capability not supported by device.
WFS_PTR_PAPERUNKNOWN	Status cannot be determined with device in
	its current state.
WFS_PTR_PAPERJAMMED	The paper supply is jammed.

## fwPaper [WFS PTR SUPPLYLOWER]

Specifies the state of the lower paper supply as one of the following values:

Value	Meaning
WFS_PTR_PAPERFULL	The paper supply is full.
WFS_PTR_PAPERLOW	The paper supply is low.
WFS_PTR_PAPEROUT	The paper supply is empty.
WFS_PTR_PAPERNOTSUPP	Capability not supported by device.
WFS_PTR_PAPERUNKNOWN	Status cannot be determined with device in
	its current state.
WFS_PTR_PAPERJAMMED	The paper supply is jammed.

## fwPaper [WFS PTR SUPPLYEXTERNAL]

Specifies the state of the external paper supply as one of the following values:

Value	Meaning
WFS PTR PAPERFULL	The paper supply is full.
WFS_PTR_PAPERLOW	The paper supply is low.
WFS_PTR_PAPEROUT	The paper supply is empty.
WFS_PTR_PAPERNOTSUPP	Capability not supported by device.
WFS_PTR_PAPERUNKNOWN	Status cannot be determined with device in
	its current state.
WFS_PTR_PAPERJAMMED	The paper supply is jammed.

## fwPaper [WFS PTR SUPPLYAUX]

Specifies the state of the auxiliary paper supply as one of the following values:

Value	Meaning
WFS_PTR_PAPERFULL	The paper supply is full.
WFS_PTR_PAPERLOW	The paper supply is low.
WFS_PTR_PAPEROUT	The paper supply is empty.
WFS_PTR_PAPERNOTSUPP	Capability not supported by device.
WFS_PTR_PAPERUNKNOWN	Status cannot be determined with device in
	its current state.
WFS_PTR_PAPERJAMMED	The paper supply is jammed.

#### fwPaper [WFS PTR SUPPLYAUX2]

Specifies the state of the second auxiliary paper supply as one of the following values:

Value	Meaning
WFS_PTR_PAPERFULL	The paper supply is full.
WFS_PTR_PAPERLOW	The paper supply is low.
WFS_PTR_PAPEROUT	The paper supply is empty.
WFS_PTR_PAPERNOTSUPP	Capability not supported by device.
WFS_PTR_PAPERUNKNOWN	Status cannot be determined with device in
	its current state.
WFS_PTR_PAPERJAMMED	The paper supply is jammed.

#### fwPaper [WFS PTR SUPPLYPARK]

Specifies the state of the parking station as one of the following values:

Value	Meaning
WFS_PTR_PAPERFULL	The parking station is busy.
WFS_PTR_PAPEROUT	The parking station is free.
WFS_PTR_PAPERNOTSUPP	Capability not supported by device.
WFS_PTR_PAPERUNKNOWN	Status cannot be determined with device in
	its current state.
WFS_PTR_PAPERJAMMED	The parking station is jammed.

#### fwToner

Specifies the state of the toner or ink supply or the state of the ribbon as one of the following values:

Value	Meaning
WFS_PTR_TONERFULL	The toner or ink supply is full or the ribbon
	is OK.
WFS_PTR_TONERLOW	The toner or ink supply is low or the print
	contrast with a ribbon is weak.
WFS_PTR_TONEROUT	The toner or ink supply is empty or the print
	contrast with a ribbon is not sufficient any
	more.
WFS_PTR_TONERNOTSUPP	Capability not supported by device.
WFS_PTR_TONERUNKNOWN	Status of toner or ink supply or the ribbon
	cannot be determined with device in its
	current state.

#### fwInk

Specifies the status of the stamping ink in the printer as one of the following values:

Value	Meaning
WFS_PTR_INKFULL	Ink supply in device is full.
WFS_PTR_INKLOW	Ink supply in device is low.
WFS_PTR_INKOUT	Ink supply in device is empty.
WFS_PTR_INKNOTSUPP	Capability not supported by device.
WFS_PTR_INKUNKNOWN	Status of the stamping ink supply cannot be
	determined with device in its current state.

## fwLamp

Specifies the status of the printer imaging lamp as one of the following values:

Value	Meaning
WFS_PTR_LAMPOK	The lamp is OK.
WFS_PTR_LAMPFADING	The lamp should be changed.
WFS_PTR_LAMPINOP	The lamp is inoperative.
WFS_PTR_LAMPNOTSUPP	Capability not supported by device.
WFS_PTR_LAMPUNKNOWN	Status of the imaging lamp cannot be
	determined with device in its current state.

#### lppRetractBins

Pointer to a NULL terminated array of pointers to WFSPTRRETRACTBINS structures (one for each supported bin). The first pointer holds the structure for bin one, the second for bin two and so on. A NULL pointer is returned if no retract bin is supported.

#### wRetractBin

Specifies the state of the printer retract bin as one of the following values:

Value	Meaning
WFS_PTR_RETRACTBINOK	The retract bin of the printer is in a
	healthy state.
WFS_PTR_RETRACTBINFULL	The retract bin of the printer is full.
WFS_PTR_RETRACTUNKNOWN	Status cannot be determined with device
	in its current state.
WFS_PTR_RETRACTBINHIGH	The retract bin of the printer is nearly
	full.
WFS_PTR_RETRACTBINMISSING	The retract bin is missing.

#### usRetractCount

The number of media retracted to this bin. This value is persistent; it may be reset to zero by the WFS CMD PTR RESET COUNT command.

#### usMediaOnStacker

The number of media on stacker; applicable only to printers with stacking capability.

#### lpszExtra

Pointer to a list of vendor-specific, or any other extended, information. The information is returned as a series of "key=value" strings so that it is easily extensible by Service Providers. Each string is null-terminated, with the final string terminating with two null characters. An empty list may be indicated by either a NULL pointer or a pointer to two consecutive null characters.

#### dwGuidLights [...]

Specifies the state of the guidance light indicators. A number of guidance light types are defined below. Vendor specific guidance lights are defined starting from the end of the array. The maximum guidance light index is WFS PTR GUIDLIGHTS MAX.

#### Specifies the state of the guidance light indicator as

WFS\_PTR\_GUIDANCE\_NOT\_AVAILABLE, WFS\_PTR\_GUIDANCE\_OFF or a combination of the following flags consisting of one type B, optionally one type C, and optionally one type D.

Value	Meaning	Type
WFS_PTR_GUIDANCE_NOT_AVAILABLE	The status is not available.	A
WFS_PTR_GUIDANCE_OFF	The light is turned off.	A
WFS_PTR_GUIDANCE_SLOW_FLASH	The light is blinking slowly.	В
WFS_PTR_GUIDANCE_MEDIUM_FLASH	The light is blinking medium	В
	frequency.	
WFS_PTR_GUIDANCE_QUICK_FLASH	The light is blinking quickly.	В
WFS_PTR_GUIDANCE_CONTINUOUS	The light is turned on	В
	continuous (steady).	
WFS_PTR_GUIDANCE_RED	The light is red.	C
WFS_PTR_GUIDANCE_GREEN	The light is green.	C
WFS_PTR_GUIDANCE_YELLOW	The light is yellow.	C

WFS_PTR_GUIDANCE_BLUE	The light is blue.	C
WFS_PTR_GUIDANCE_CYAN	The light is cyan.	$\mathbf{C}$
WFS_PTR_GUIDANCE_MAGENTA	The light is magenta.	C
WFS_PTR_GUIDANCE_WHITE	The light is white.	C
WFS_PTR_GUIDANCE_ENTRY	The light is in the entry state.	D
WFS_PTR_GUIDANCE_EXIT	The light is in the exit state.	D

dwGuidLights [WFS PTR GUIDANCE PRINTER]

Specifies the state of the guidance light indicator on the printer unit.

#### wDevicePosition

Specifies the device position. The device position value is independent of the *fwDevice* value, e.g. when the device position is reported as WFS\_PTR\_DEVICENOTINPOSITION, *fwDevice* can have any of the values defined above (including WFS\_PTR\_DEVONLINE or WFS\_PTR\_DEVOFFLINE). If the device is not in its normal operating position (i.e. WFS\_PTR\_DEVICEINPOSITION) then media may not be presented through the normal customer interface. This value is one of the following values:

Value	Meaning
WFS_PTR_DEVICEINPOSITION	The device is in its normal operating position, or is fixed in place and cannot be moved.
WFS_PTR_DEVICENOTINPOSITION	The device has been removed from its normal operating position.
WFS_PTR_DEVICEPOSUNKNOWN	Due to a hardware error or other condition, the position of the device cannot be determined.
WFS_PTR_DEVICEPOSNOTSUPP	The physical device does not have the capability of detecting the position.

#### usPowerSaveRecoveryTime

Specifies the actual number of seconds required by the device to resume its normal operational state from the current power saving mode. This value is zero if either the power saving mode has not been activated or no power save control is supported.

#### wPaperType [...]

Specifies the type of paper loaded in the device. A number of paper types are defined below. Vendor specific paper types are defined starting from the end of the array. The maximum paper index is WFS PTR SUPPLYMAX.

#### wPaperType [WFS PTR SUPPLYUPPER]

Specifies the type of paper loaded in the only paper supply or the upper paper supply, if more than one, as one of the following values:

Value	Meaning
WFS_PTR_PAPERSINGLESIDED	The paper can be printed on only one side.
WFS_PTR_PAPERDUALSIDED	The paper can be printed on both sides.
WFS_PTR_PAPERTYPEUNKNOWN	No paper is loaded, reporting of this paper
	type is not supported
	(fwPaper[]=WFS_PTR_PAPERNOTSUP
	P) or the paper type cannot be determined.

#### wPaperType [WFS PTR SUPPLYLOWER]

Specifies the type of paper loaded in the lower paper supply as one of the following values:

Value	Meaning
WFS_PTR_PAPERSINGLESIDED	The paper can be printed on only one side.
WFS_PTR_PAPERDUALSIDED	The paper can be printed on both sides.
WFS_PTR_PAPERTYPEUNKNOWN	No paper is loaded, reporting of this paper
	type is not supported
	(fwPaper[]=WFS_PTR_PAPERNOTSUP
	P) or the paper type cannot be determined.

## wPaperType [WFS\_PTR\_SUPPLYEXTERNAL]

Specifies the type of paper loaded in the external paper supply as one of the following values:

Meaning
The paper can be printed on only one side.
The paper can be printed on both sides.
No paper is loaded, reporting of this paper
type is not supported
(fwPaper[]=WFS_PTR_PAPERNOTSUP
P) or the paper type cannot be determined.

#### wPaperType [WFS PTR SUPPLYAUX]

Specifies the type of paper loaded in the auxiliary paper supply as one of the following values:

Value	Meaning
WFS_PTR_PAPERSINGLESIDED	The paper can be printed on only one side.
WFS_PTR_PAPERDUALSIDED	The paper can be printed on both sides.
WFS_PTR_PAPERTYPEUNKNOWN	No paper is loaded, reporting of this paper
	type is not supported
	(fwPaper[]=WFS_PTR_PAPERNOTSUP
	P) or the paper type cannot be determined.

## wPaperType [WFS PTR SUPPLYAUX2]

Specifies the type of paper loaded in the second auxiliary paper supply as one of the following values:

Value	Meaning
WFS_PTR_PAPERSINGLESIDED	The paper can be printed on only one side.
WFS_PTR_PAPERDUALSIDED	The paper can be printed on both sides.
WFS_PTR_PAPERTYPEUNKNOWN	No paper is loaded, reporting of this paper
	type is not supported
	(fwPaper[]=WFS_PTR_PAPERNOTSUP
	P) or the paper type cannot be determined.

## wPaperType [WFS PTR SUPPLYPARK]

Specifies the type of paper in the parking station as one of the following values:

Value	Meaning
WFS_PTR_PAPERSINGLESIDED	The paper can be printed on only one side.
WFS_PTR_PAPERDUALSIDED	The paper can be printed on both sides.
WFS_PTR_PAPERTYPEUNKNOWN	No paper is loaded, reporting of this paper
	type is not supported
	(fwPaper[]=WFS_PTR_PAPERNOTSUP
	P) or the paper type cannot be determined.

## w Anti Fraud Module

Specifies the state of the anti-fraud module as one of the following values:

Value	Meaning
WFS_PTR_AFMNOTSUPP	No anti-fraud module is available.
WFS_PTR_AFMOK	Anti-fraud module is in a good state and no
	foreign device is detected.
WFS_PTR_AFMINOP	Anti-fraud module is inoperable.
WFS_PTR_AFMDEVICEDETECTED	Anti-fraud module detected the presence of a
	foreign device.
WFS_PTR_AFMUNKNOWN	The state of the anti-fraud module cannot be
	determined.

#### wBlackMarkMode

Specifies the status of the black mark detection and associated functionality:

Value	Meaning
WFS_PTR_BLACKMARKDETECTIONNOTS	SUPP
	Black mark detection is not supported.
WFS_PTR_BLACKMARKDETECTIONON	Black mark detection and associated
	functionality is switched on.
WFS_PTR_BLACKMARKDETECTIONOFF	Black mark detection and associated
	functionality is switched off.

## WFS PTR BLACKMARKDETECTIONUNKNOWN

The status of the black mark detection cannot be determined.

#### **Error Codes**

Only the generic error codes defined in [Ref. 1] can be generated by this command.

#### **Comments**

Applications which require or expect specific information to be present in the *lpszExtra* parameter may not be device or vendor-independent.

In the case where communications with the device has been lost, the *fwDevice* field will report WFS\_PTR\_DEVPOWEROFF when the device has been removed or WFS\_PTR\_DEVHWERROR if the communications are unexpectedly lost. All other fields should contain a value based on the following rules and priority:

- 1. Report the value as unknown.
- 2. Report the value as a general h/w error.
- 3. Report the value as the last known value.

## 7.2 WFS\_INF\_PTR\_CAPABILITIES

**Description** This command is used to request device capability information.

Input Param None.

Output Param LPWFSPTRCAPS lpCaps;

```
typedef struct wfs ptr caps
     WORD
                           wClass;
     WORD

```

#### wClass

Specifies the logical service class as WFS\_SERVICE\_CLASS\_PTR.

#### fwType

Specifies the type(s) of the physical device driven by the logical service, as a combination of the following flags:

Value	Meaning
WFS_PTR_TYPERECEIPT	Device is a receipt printer.
WFS_PTR_TYPEPASSBOOK	Device is a passbook printer.
WFS_PTR_TYPEJOURNAL	Device is a journal printer.
WFS_PTR_TYPEDOCUMENT	Device is a document printer.
WFS_PTR_TYPESCANNER	Device is a scanner that may have printing capabilities.

#### **bCompound**

Specifies whether the logical device is part of a compound physical device.

#### wResolution

Specifies at which resolution(s) the physical device can print. Used by the application to select the level of print quality desired (e.g. as in Word for Windows); does not imply any absolute level of resolution, only relative. Specified as a combination of the following flags:

Value	Meaning
WFS_PTR_RESLOW	Can print with low resolution.
WFS_PTR_RESMED	Can print with medium resolution.
WFS_PTR_RESHIGH	Can print with high resolution.
WFS_PTR_RESVERYHIGH	Can print with very high resolution.

#### fwReadForm

Specifies whether the device can read data from media, as a combination of the following flags (zero if none of the choices is supported):

Value	Meaning
WFS_PTR_READOCR	Device has OCR capability.
WFS_PTR_READMICR	Device has MICR capability.
WFS_PTR_READMSF	Device has MSF capability.
WFS_PTR_READBARCODE	Device has Barcode capability.
WFS_PTR_READPAGEMARK	Device has Page Mark capability.
WFS_PTR_READIMAGE	Device has imaging capability.
WFS_PTR_READEMPTYLINE	Device has capability to detect empty print
	lines for passbook printing.

#### fwWriteForm

Specifies whether the device can write data to the media, as a combination of the following flags (zero if none of the choices is supported):

Value	Meaning
WFS_PTR_WRITETEXT	Device has Text capability.
WFS_PTR_WRITEGRAPHICS	Device has Graphics capability.
WFS_PTR_WRITEOCR	Device has OCR capability.
WFS_PTR_WRITEMICR	Device has MICR capability.
WFS_PTR_WRITEMSF	Device has MSF capability.
WFS_PTR_WRITEBARCODE	Device has Barcode capability.
WFS_PTR_WRITESTAMP	Device has stamping capability.

#### *fwExtents*

Specifies whether the device is able to measure the inserted media, as a combination of the following flags (zero if none of the choices is supported):

Value	Meaning
WFS_PTR_EXTHORIZONTAL	Device has horizontal size detection
	capability.
WFS PTR EXTVERTICAL	Device has vertical size detection capability.

#### *fwControl*

Specifies the manner in which media can be controlled, as a combination of the following flags (zero if none of the choices is supported). This field is deprecated. The values for *fwControl* are reported using the *dwControlEx* field.

Value	Meaning
WFS_PTR_CTRLEJECT	Device can eject media.
WFS_PTR_CTRLPERFORATE	Device can perforate media.
WFS_PTR_CTRLCUT	Device can cut media.
WFS_PTR_CTRLSKIP	Device can skip to mark.
WFS_PTR_CTRLFLUSH	Device can be sent data that is buffered
	internally, and flushed to the printer on request.
WFS_PTR_CTRLRETRACT	Device can retract media under application control.
WFS_PTR_CTRLSTACK	Device can stack media items before ejecting as a bundle.
WFS_PTR_CTRLPARTIALCUT	Device can partially cut the media.
WFS_PTR_CTRLALARM	Device can ring a bell, beep or otherwise sound an audible alarm.
WFS_PTR_CTRLATPFORWARD	Capability to turn one page forward.
WFS_PTR_CTRLATPBACKWARD	Capability to turn one page backward.
WFS_PTR_CTRLTURNMEDIA	Device can turn inserted media.

7	WFS PTR CTRLSTAMP	Device can stamp on media.
7	WFS_PTR_CTRLPARK	Device can park a document into the parking
		station.
7	WFS_PTR_CTRLEXPEL	Device can expel media out of the exit slot.
7	WFS_PTR_CTRLEJECTTOTRANSPORT	Device can move media to a position on the
		transport just behind the exit slot.

#### usMaxMediaOnStacker

Specifies the maximum number of media items that the stacker can hold (zero if not available).

#### bAcceptMedia

Specifies whether the device is able to accept media while no execute command is running that is waiting explicitly for media to be inserted. Its value is either TRUE or FALSE.

#### bMultiPage

Specifies whether the device is able to support multiple page print jobs. Its value is either TRUE or FALSE.

#### fwPaperSources

Specifies the paper sources available for this printer as a combination of the following flags:

Value	Meaning
WFS_PTR_PAPERUPPER	Indicates an upper paper source is available; devices with only one paper supply must indicate WFS_PTR_PAPERUPPER as being available.
WFS PTR PAPERLOWER	Indicates a lower paper source is available.
WFS_PTR_PAPEREXTERNAL	Indicates an external paper source (such as envelope tray or single sheet feed) is available.
WFS_PTR_PAPERAUX	An auxiliary paper source is available.
WFS_PTR_PAPERAUX2	A second auxiliary paper source is available.
WFS PTR PAPERPARK	A parking station is available.

#### bMediaTaken

Specifies whether the device is able to detect when the media is taken from the exit slot. If FALSE, the WFS\_SRVE\_PTR\_MEDIATAKEN event is not fired. Its value is either TRUE or FALSE.

#### usRetractBins

Specifies the number of retract bins (zero if not supported).

## lpusMaxRetract

Pointer to an array of the length *usRetractBins* with the maximum number of media items that each retract bin can hold (one count for each supported bin, starting from zero for bin number one to *usRetractBins*-1 for bin number *usRetractBins*). NULL pointer if the device has no retract bin.

## fwImageType

Specifies the image format supported by this device, as a combination of following flags (zero if not supported):

Value	Meaning
WFS_PTR_IMAGETIF	The device can return scanned images in
	TIFF 6.0 format.
WFS_PTR_IMAGEWMF	The device can return scanned images in
	WMF (Windows Metafile) format.
WFS_PTR_IMAGEBMP	The device can return scanned images in
	Windows BMP format.
WFS PTR IMAGEJPG	The device can return scanned images in
	JPG format.

#### fwFrontImageColorFormat

Specifies the front image color formats supported by this device, as a combination of following flags (zero if not supported):

Value	Meaning
WFS_PTR_IMAGECOLORBINARY	The device can return scanned images in
	binary (image contains two colors, usually
	the colors black and white).
WFS_PTR_IMAGECOLORGRAYSCALE	The device can return scanned images in
	gray scale (image contains multiple gray
	colors).
WFS_PTR_IMAGECOLORFULL	The device can return scanned images in full
	color (image contains colors like red, green,
	blue etc.).

#### fwBackImageColorFormat

Specifies the back image color formats supported by this device, as a combination of following flags (zero if not supported):

Value	Meaning
WFS_PTR_IMAGECOLORBINARY	The device can return scanned images in
	binary (image contains two colors, usually
	the colors black and white).
WFS_PTR_IMAGECOLORGRAYSCALE	The device can return scanned images in gray scale (image contains multiple gray colors).
WFS_PTR_IMAGECOLORFULL	The device can return scanned images in full color (image contains colors like red, green, blue etc.).

#### fwCodelineFormat

Specifies the code line (MICR data) formats supported by this device, as a combination of following flags (zero if not supported):

Value	Meaning
WFS_PTR_CODELINECMC7	The device can read CMC7 code lines.
WFS_PTR_CODELINEE13B	The device can read E13B code lines.
WFS_PTR_CODELINEOCR	The device can read code lines using Optical
	Character Recognition.

#### fwImageSource

Specifies the source for the read image command supported by this device, as a combination of the following flags (zero if not supported):

Value	Meaning
WFS_PTR_IMAGEFRONT	The device can scan the front image of the
	document.
WFS_PTR_IMAGEBACK	The device can scan the back image of the
	document.
WFS_PTR_CODELINE	The device can recognize the code line.
WFS_PTR_PASSPORT_DG1_RFID	The device can scan a passport for Data
	Group 1 using RFID [Ref. 2].
WFS_PTR_PASSPORT_DG2_RFID	The device can scan a passport for Data
	Group 2 using RFID [Ref. 2].

#### fwCharSupport

One or more flags specifying the character sets, in addition to single byte ASCII, that is supported by the Service Provider:

Value	Meaning
WFS_PTR_ASCII	ASCII is supported for XFS forms.
WFS_PTR_UNICODE	UNICODE is supported for XFS forms.

For *fwCharSupport*, a Service Provider can support ONLY ASCII forms or can support BOTH ASCII and UNICODE forms. A Service Provider cannot support UNICODE forms without also supporting ASCII forms.

## bDispense Paper

Specifies whether the device is able to dispense paper. Its value is either TRUE or FALSE.

#### lpszExtra

Pointer to a list of vendor-specific, or any other extended, information. The information is returned as a series of "key=value" strings so that it is easily extensible by Service Providers. Each string is null-terminated, with the final string terminating with two null characters. An empty list may be indicated by either a NULL pointer or a pointer to two consecutive null characters.

#### dwGuidLights [...]

Specifies which guidance lights are available. A number of guidance light types are defined below. Vendor specific guidance lights are defined starting from the end of the array. The maximum guidance light index is WFS PTR GUIDLIGHTS MAX.

In addition to supporting specific flash rates and colors, some guidance lights also have the capability to show directional movement representing "entry" and "exit". The "entry" state gives the impression of leading a user to place media into the device. The "exit" state gives the impression of ejection from a device to a user and would be used for retrieving media from the device.

The elements of this array are specified as a combination of the following flags and indicate all of the possible flash rates (type B, colors (type C) and directions (type D) that the guidance light indicator is capable of handling. If the guidance light indicator only supports one color then no value of type C is returned. If the guidance light indicator does not support direction then no value of type D is returned. A value of WFS\_PTR\_GUIDANCE\_NOT\_AVAILABLE indicates that the device has no guidance light indicator or the device controls the light directly with no application control possible.

Value	Meaning	Type
WFS_PTR_GUIDANCE_NOT_AVAILABLE	There is no guidance light control	A
	available at this position.	
WFS_PTR_GUIDANCE_OFF	The light can be off.	В
WFS_PTR_GUIDANCE_SLOW_FLASH	The light can blink slowly.	В
WFS_PTR_GUIDANCE_MEDIUM_FLASH	The light can blink medium	В
	frequency.	
WFS_PTR_GUIDANCE_QUICK_FLASH	The light can blink quickly.	В
WFS_PTR_GUIDANCE_CONTINUOUS	The light can be	В
	continuous (steady).	
WFS_PTR_GUIDANCE_RED	The light can be red.	C
WFS_PTR_GUIDANCE_GREEN	The light can be green.	C
WFS_PTR_GUIDANCE_YELLOW	The light can be yellow.	C
WFS_PTR_GUIDANCE_BLUE	The light can be blue.	C
WFS_PTR_GUIDANCE_CYAN	The light can be cyan.	C
WFS_PTR_GUIDANCE_MAGENTA	The light can be magenta.	C
WFS_PTR_GUIDANCE_WHITE	The light can be white.	C
WFS_PTR_GUIDANCE_ENTRY	The light can be in the entry state.	D
WFS_PTR_GUIDANCE_EXIT	The light can be in the exit state.	D

## dwGuidLights [WFS\_PTR\_GUIDANCE\_PRINTER]

Specifies whether the guidance light indicator on the printer unit is available.

#### lpszWindowsPrinter

Specifies the name of the default logical Windows printer that is associated with this Service Provider. Applications should use this printer name to generate native printer files (i.e. .PRN) to be printed through the WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command. This value will be NULL if the Service Provider does not support the WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command.

#### **bMediaPresented**

Specifies whether the device is able to detect when the media is presented to the user for removal. If TRUE, the WFS\_EXEE\_PTR\_MEDIAPRESENTED event is fired. If FALSE, the WFS\_EXEE\_PTR\_MEDIAPRESENTED event is not fired.

#### usAutoRetractPeriod

Specifies the number of seconds before the device will automatically retract the presented media. If the command that generated the media is still active when the media is automatically retracted, the command will complete with a WFS\_ERR\_PTR\_MEDIARETRACTED error. If the device does not retract media automatically this value will be zero.

#### CWA 16926-3:2022 (E)

#### bRetractToTransport

Specifies whether the device is able to retract the previously ejected media to the transport. Its value is either TRUE or FALSE.

#### bPowerSaveControl

Specifies whether power saving control is available. This can either be TRUE if available or FALSE if not available.

#### fwCoercivityType

Specifies the form write modes supported by this device, as a combination of the following flags:

Value	Meaning
WFS_PTR_COERCIVITYNOTSUPP	This device cannot write the magnetic stripe.
WFS_PTR_COERCIVITYLOW	This device can write the magnetic stripe by
	low coercivity mode.
WFS_PTR_COERCIVITYHIGH	This device can write the magnetic stripe by
	high coercivity mode.
WFS_PTR_COERCIVITYAUTO	The Service Provider or the device is capable
	of automatically determining whether low or
	high coercivity magnetic stripe should be
	written.

#### fwControlPassbook

Specifies how the passbook can be controlled with the

WFS CMD PTR CONTROL PASSBOOK command, as a combination of the following flags:

Value	Meaning
WFS_PTR_PBKCTRLNOTSUPP	The device is not capable of turning multiple pages of the passbook or closing the passbook.
WFS_PTR_PBKCTRLTURNFORWARD	The device can turn forward multiple pages of the passbook.
WFS_PTR_PBKCTRLTURNBACKWARD	The device can turn backward multiple pages of the passbook.
WFS PTR PBKCTRLCLOSEFORWARD	The device can close the passbook forward.
WFS_PTR_PBKCTRLCLOSEBACKWARD	The device can close the passbook backward.

#### wPrintSides

Specifies on which sides of the media this device can print as one of the following values:

Value	Meaning
WFS_PTR_PRINTSIDESNOTSUPP	The device is not capable of printing on any
	sides of the media.
WFS_PTR_PRINTSIDESSINGLE	The device is capable of printing on one side
	of the media.
WFS_PTR_PRINTSIDESDUAL	The device is capable of printing on two
	sides of the media.

#### bAntiFraudModule

Specifies whether the anti-fraud module is available. This can either be TRUE if available or FALSE if not available.

#### dwControlEx

Specifies the manner in which media can be controlled, as a combination of the following flags (zero if none of the choices is supported). For backwards compatibility the *fwControl* field is preserved. The definitions for the *fwControl* field are included as this field supersedes the *fwControl* field.

Value	Meaning
WFS_PTR_CTRLEJECT	Device can eject media.
WFS_PTR_CTRLPERFORATE	Device can perforate media.
WFS_PTR_CTRLCUT	Device can cut media.
WFS_PTR_CTRLSKIP	Device can skip to mark.

WFS PTR CTRLFLUSH Device can be sent data that is buffered

internally, and flushed to the printer on

request.

WFS PTR CTRLRETRACT Device can retract media under application

control.

Device can stack media items before ejecting WFS PTR CTRLSTACK

as a bundle.

WFS PTR CTRLPARTIALCUT Device can partially cut the media. WFS PTR CTRLALARM

Device can ring a bell, beep or otherwise

sound an audible alarm.

WFS PTR CTRLATPFORWARD Capability to turn one page forward. WFS PTR CTRLATPBACKWARD Capability to turn one page backward. WFS PTR CTRLTURNMEDIA Device can turn inserted media.

WFS PTR CTRLSTAMP Device can stamp on media. WFS PTR CTRLPARK

Device can park a document into the parking

WFS PTR CTRLEXPEL Device can expel media out of the exit slot. WFS PTR CTRLEJECTTOTRANSPORT

Device can move media to a position on the transport just behind the exit slot.

WFS PTR CTRLROTATE180 Device can rotate media 180 degrees in the

printing plane.

WFS PTR CTRLCLEARBUFFER The Service Provider can clear buffered data.

bBlackMarkModeSupported

Specifies if setting the black mark mode with the command

WFS CMD PTR SET BLACK MARK MODE is supported. This can either be TRUE if supported or FALSE if not supported.

lpdwSynchronizableCommands

Pointer to a zero-terminated list of DWORDs which contains the execute command IDs that can be synchronized. If no execute command can be synchronized then this parameter will be NULL.

**Error Codes** Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Comments** Applications which require or expect specific information to be present in the *lpszExtra* parameter

may not be device or vendor-independent.

## 7.3 WFS\_INF\_PTR\_FORM\_LIST

**Description** This command is used to retrieve the list of forms available on the device.

Input Param None.

Output Param LPSTR lpszFormList;

lpszFormList

Pointer to a list of null-terminated form names, with the final name terminating with two null

characters.

**Error Codes** Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Comments** None.

## 7.4 WFS\_INF\_PTR\_MEDIA\_LIST

**Description** This command is used to retrieve the list of media definitions available on the device.

Input Param None.

Output Param LPSTR lpszMediaList;

lpszMediaList

Pointer to a list of null-terminated media names, with the final name terminating with two null

characters.

**Error Codes** Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Comments** None.

## 7.5 WFS\_INF\_PTR\_QUERY\_FORM

**Description** This command is used to retrieve details of the definition of a specified form.

Input Param LPSTR lpszFormName;

lpszFormName

Points to the null-terminated form name on which to retrieve details.

#### Output Param LPWFSFRMHEADER lpHeader;

```
typedef struct _wfs_frm_header
     LPSTR
                            lpszFormName;
     WORD
                            wBase;
     WORD
                            wUnitX;
                            wUnitY;
     WORD
     WORD
                            wWidth;
                            wHeight;
     WORD
     WORD
                            wAlianment;
     WORD
                            wOrientation;
                            wOffsetX;
     WORD
     WORD
                            wOffsetY;
     WORD
                            wVersionMajor;
     WORD
                            wVersionMinor;
     LPSTR
                            lpszUserPrompt;
     WORD
                            fwCharSupport;
     LPSTR
                            lpszFields;
     WORD
                            wLanguageID;
     } WFSFRMHEADER, *LPWFSFRMHEADER;
```

lpszFormName

Specifies the null-terminated name of the form.

wBase

Specifies the base unit of measurement of the form and can be one of the following:

Value	Meaning
WFS_FRM_INCH	The base unit is inches.
WFS_FRM_MM	The base unit is millimeters.
WFS FRM ROWCOLUMN	The base unit is rows and columns.

wUnitX

Specifies the horizontal resolution of the base units as a fraction of the *wBase* value. For example, a value of 16 applied to the base unit WFS\_FRM\_INCH means that the base horizontal resolution is 1/16".

wUnitY

Specifies the vertical resolution of the base units as a fraction of the *wBase* value. For example, a value of 10 applied to the base unit WFS\_FRM\_MM means that the base vertical resolution is 0.1 mm.

wWidth

Specifies the width of the form in terms of the base horizontal resolution.

wHeighi

Specifies the height of the form in terms of the base vertical resolution.

wAlignment

Specifies the relative alignment of the form on the media and can be one of the following values:

Value	Meaning
WFS_FRM_TOPLEFT	The form is aligned relative to the top and
	left edges of the media.
WFS_FRM_TOPRIGHT	The form is aligned relative to the top and
	right edges of the media.
WFS_FRM_BOTTOMLEFT	The form is aligned relative to the bottom
	and left edges of the media.
WFS_FRM_BOTTOMRIGHT	The form is aligned relative to the bottom
	and right edges of the media.

#### wOrientation

Specifies the orientation of the form and can be one of the following values:

Value	Meaning
WFS FRM PORTRAIT	The orientation of the form is portrait.
WFS FRM LANDSCAPE	The orientation of the form is landscape.

#### wOffsetX

Specifies the horizontal offset of the position of the top-left corner of the form, relative to the left or right edge specified by *wAlignment*. This value is specified in terms of the base horizontal resolution and is always positive.

#### wOffsetY

Specifies the vertical offset of the position of the top-left corner of the form, relative to the top or bottom edge specified by *wAlignment*. This value is specified in terms of the base vertical resolution and is always positive.

#### wVersionMajor

Specifies the major version of the form. If the version is not specified in the form, then zero is returned.

#### wVersionMinor

Specifies the minor version of the form. If the version is not specified in the form, then zero is returned.

#### *lpszUserPrompt*

Pointer to a null-terminated user prompt string. NULL will be returned if the form does not define a value for the user prompt.

#### fwCharSupport

A single flag specifying the Character Set in which the form is encoded:

Value	Meaning
WFS_PTR_ASCII	ASCII is supported for XFS forms initial
	data values and FORMAT strings.
WFS_PTR_UNICODE	UNICODE is supported for XFS forms
	initial data values and FORMAT strings.

#### *lpszFields*

Pointer to a list of null-terminated field names, with the final name terminating with two null characters.

#### wLanguageID

Specifies the language identifier for the form.

#### **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_FORMNOTFOUND	The specified form cannot be found.
WFS_ERR_PTR_FORMINVALID	The specified form is invalid.

#### Comments

None.

## 7.6 WFS\_INF\_PTR\_QUERY\_MEDIA

**Description** This command is used to retrieve details of the definition of a specified media.

Input Param LPSTR lpszMediaName;

*lpszMediaName* 

Pointer to the null-terminated media name about which to retrieve details.

#### Output Param LPWFSFRMMEDIA lpMedia;

```
typedef struct _wfs_frm_media
     WORD
                            fwMediaType;
     WORD
                           wBase;
     WORD
                           wUnitX;
     WORD
                           wUnitY;
     WORD
                            wSizeWidth;
                           wSizeHeight;
     WORD
     WORD
                           wPageCount;
     WORD
                            wLineCount;
     WORD
                           wPrintAreaX;
     WORD
                            wPrintAreaY;
     WORD
                            wPrintAreaWidth;
     WORD
                           wPrintAreaHeight;
     WORD
                            wRestrictedAreaX;
     WORD
                            wRestrictedAreaY;
     WORD
                            wRestrictedAreaWidth;
     WORD
                            wRestrictedAreaHeight;
     WORD
                           wStagger;
     WORD
                            wFoldType;
     WORD
                            wPaperSources;
     } WFSFRMMEDIA, *LPWFSFRMMEDIA;
```

#### fwMediaType

Specifies the type of media as one of the following values:

Value	Meaning
WFS_FRM_MEDIAGENERIC	The media is a generic media, i.e. a single
	sheet.
WFS FRM MEDIAPASSBOOK	The media is a passbook media.
WFS_FRM_MEDIAMULTIPART	The media is a multi-part media.

#### wBase

Specifies the base unit of measurement of the form and can be one of the following values:

Value	Meaning
WFS_FRM_INCH	The base unit is inches.
WFS_FRM_MM	The base unit is millimeters.
WFS_FRM_ROWCOLUMN	The base unit is rows and columns.

## wUnitX

Specifies the horizontal resolution of the base units as a fraction of the *wBase* value. For example, a value of 16 applied to the base unit WFS\_FRM\_INCH means that the base horizontal resolution is 1/16".

#### wUnitY

Specifies the vertical resolution of the base units as a fraction of the *wBase* value. For example, a value of 10 applied to the base unit WFS\_FRM\_MM means that the base vertical resolution is 0.1 mm.

#### wSizeWidth

Specifies the width of the media in terms of the base horizontal resolution.

#### wSizeHeight

Specifies the height of the media in terms of the base vertical resolution.

#### wPageCount

Specifies the number of pages in a media of type WFS\_FRM\_MEDIAPASSBOOK.

wLineCount

Specifies the number of lines on a page for a media of type WFS\_FRM\_MEDIAPASSBOOK.

wPrintAreaX

Specifies the horizontal offset of the printable area relative to the top left corner of the media in terms of the base horizontal resolution.

wPrintAreaY

Specifies the vertical offset of the printable area relative to the top left corner of the media in terms of the base vertical resolution.

wPrintAreaWidth

Specifies the printable area width of the media in terms of the base horizontal resolution.

wPrintAreaHeight

Specifies the printable area height of the media in terms of the base vertical resolution.

wRestrictedAreaX

Specifies the horizontal offset of the restricted area relative to the top left corner of the media in terms of the base horizontal resolution.

wRestrictedAreaY

Specifies the vertical offset of the restricted area relative to the top left corner of the media in terms of the base vertical resolution.

wRestrictedAreaWidth

Specifies the restricted area width of the media in terms of the base horizontal resolution.

wRestrictedAreaHeight

Specifies the restricted area height of the media in terms of the base vertical resolution.

wStagger

Specifies the staggering from the top in terms of the base vertical resolution for a media of type WFS FRM MEDIAPASSBOOK.

wFoldType

Specified the type of fold (vertical, horizontal or none) for a media of type WFS FRM MEDIAPASSBOOK as one of the following values:

Value	Meaning
WFS_FRM_FOLDNONE	Passbook has no fold.
WFS_FRM_FOLDHORIZONTAL	Passbook has a horizontal fold.
WFS FRM FOLDVERTICAL	Passbook has a vertical fold.

#### wPaperSources

Specifies the Paper sources to use when printing forms using this media as a combination of the following flags:

Value	Meaning
WFS_PTR_PAPERANY	Use any paper source.
WFS_PTR_PAPERUPPER	Use the only or the upper paper source.
WFS_PTR_PAPERLOWER	Use the lower paper source.
WFS_PTR_PAPEREXTERNAL	Use the external paper source.
WFS_PTR_PAPERAUX	Use the auxiliary paper source.
WFS_PTR_PAPERAUX2	Use the second auxiliary paper source.
WFS_PTR_PAPERPARK	Use the parking station.

#### **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_MEDIANOTFOUND	The specified media definition cannot be found.
WFS_ERR_PTR_MEDIAINVALID	The specified media definition is invalid.

#### Comments

None.

## WFS\_INF\_PTR\_QUERY\_FIELD

#### **Description**

This command is used to retrieve details of the definition of a single or all fields on a specified

#### **Input Param**

#### LPWFSPTRQUERYFIELD lpQueryField;

```
typedef struct _wfs_ptr_query_field
     LPSTR
                           lpszFormName;
     LPSTR
                           lpszFieldName;
     } WFSPTROUERYFIELD, *LPWFSPTROUERYFIELD;
```

#### *lpszFormName*

Pointer to the null-terminated form name.

#### lpszFieldName

Pointer to the null-terminated name of the field about which to retrieve details. If the value of lpszFieldName is NULL, then details are retrieved for all fields on the form. Depending upon whether the form is encoded in UNICODE representation either the *lpszInitialValue* or lpszUNICODEInitialValue output fields are used to retrieve the field Initial Value.

#### Output Param LPWFSFRMFIELD \*lppFields;

#### lppFields

Pointer to a null-terminated array of pointers to WFSFRMFIELD structures:

```
typedef struct _wfs_frm_field
     LPSTR
                           lpszFieldName;
     WORD
                           wIndexCount;
     WORD
                            fwType;
     WORD
                            fwClass;
     WORD
                           fwAccess;
     WORD
                            fwOverflow;
     LPSTR
                           lpszInitialValue;
     LPWSTR
                           lpszUNICODEInitialValue;
     LPSTR
                            lpszFormat;
     LPWSTR
                           lpszUNICODEFormat;
     WORD
                           wLanguageID;
     WORD
                            wCoercivity;
     } WFSFRMFIELD, *LPWFSFRMFIELD;
```

#### lpszFieldName

Pointer to the null-terminated field name.

Specifies the number of entries for an index field. A value of zero indicates that this field is not an index field. Index fields are typically used to present information in a tabular fashion.

Specifies the type of field and can be one of the following values:

Value	Meaning
WFS_FRM_FIELDTEXT	The field is a text field.
WFS_FRM_FIELDMICR	The field is a Magnetic Ink Character
	Recognition field.
WFS_FRM_FIELDOCR	The field is an Optical Character
	Recognition field.
WFS_FRM_FIELDMSF	The field is a Magnetic Stripe Facility field.
WFS_FRM_FIELDBARCODE	The field is a Barcode field.
WFS_FRM_FIELDGRAPHIC	The field is a Graphic field.
WFS_FRM_FIELDPAGEMARK	The field is a Page Mark field.

#### **fwClass**

Specifies the class of the field and can be one of the following values:

Value	Meaning
WFS_FRM_CLASSSTATIC	The field data cannot be set by the
	application.

WFS	FRM	CLASSOPTIONAL
WFS	FRM	CLASSREQUIRED

The field data can be set by the application. The field data must be set by the application.

## fwAccess

Specifies whether the field is to be used for input, output, or both and can be a combination of the following flags:

Value	Meaning
WFS_FRM_ACCESSREAD	The field is used for input.
WFS_FRM_ACCESSWRITE	The field is used for output.

## fwOverflow

Specifies how an overflow of field data should be handled and can be one of the following values:

Value	Meaning
WFS_FRM_OVFTERMINATE	Return an error and terminate printing of the
	form.
WFS_FRM_OVFTRUNCATE	Truncate the field data to fit in the field.
WFS FRM OVFBESTFIT	Fit the text in the field.
WFS_FRM_OVFOVERWRITE	Print the field data beyond the extents of the
	field boundary.
WFS_FRM_OVFWORDWRAP	If the field can hold more than one line the
	text is wrapped around. Wrapping is
	performed, where possible, by splitting the
	line on a space character or a hyphen
	character or any other character which is
	used to join two words together.

## lpszInitialValue

The initial value of the field. When the form is printed (using WFS\_CMD\_PTR\_PRINT\_FORM), this value will be used if another value is not provided. This value can be NULL if the parameter is not specified in the field definition or the form is encoded in UNICODE.

## lpszUNICODEInitialValue

The initial value of the field when form is encoded in UNICODE. When the form is printed (using WFS\_CMD\_PTR\_PRINT\_FORM), this value will be used if another value is not provided. This value can be NULL if the parameter is not specified in the field definition or the form is not encoded in UNICODE.

## *lpszFormat*

Format string as defined in the form for this field. This value can be NULL if the parameter is not specified in the field definition or the form is encoded in UNICODE.

## lpszUNICODEFormat

Format string as defined in the form for this field when form is encoded in UNICODE. This value can be NULL if the parameter is not specified in the field definition or the form is not encoded in UNICODE.

## wLanguageID

Specifies the language identifier for the field.

## wCoercivity

Specifies the coercivity to be used for writing the magnetic stripe.

Value	Meaning
WFS_FRM_COERCIVITYAUTO	The coercivity is decided by the Service
	Provider or the hardware.
WFS_FRM_COERCIVITYLOW	A low coercivity is to be used for writing the
	magnetic stripe.
WFS_FRM_COERCIVITYHIGH	A high coercivity is to be used for writing
	the magnetic stripe.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_FORMNOTFOUND	The specified form cannot be found.
WFS ERR PTR FIELDNOTFOUND	The specified field cannot be found.

## CWA 16926-3:2022 (E)

WFS\_ERR\_PTR\_FORMINVALID WFS\_ERR\_PTR\_FIELDINVALID

The specified form is invalid. The specified field is invalid.

Comments None.

#### WFS\_INF\_PTR\_CODELINE\_MAPPING 7.8

## **Description**

This command is used to retrieve the byte code mapping for the special banking symbols defined for image processing (e.g. check processing). This mapping must be reported as there is no standard for the fonts defined below.

## **Input Param**

## LPWFSPTRCODELINEMAPPING lpCodelineMapping;

```
typedef struct _wfs_ptr_codeline_mapping
     {
     WORD
                          wCodelineFormat;
     } WFSPTRCODELINEMAPPING, *LPWFSPTRCODELINEMAPPING;
```

#### wCodeLineFormat

Specifies the code-line format that the mapping for the special characters is required for. This field can be one of the following values:

Value	Meaning
WFS_PTR_CODELINECMC7	Report the CMC7 mapping.
WFS_PTR_CODELINEE13B	Report the E13B mapping.

## Output Param LPWFSPTRCODELINEMAPPINGOUT lpCodelineMapping;

```
typedef struct _wfs_ptr_codeline_mapping_out
     WORD
                          wCodelineFormat;
     LPWFSPTRXDATA
                          lpxCharMapping;
     } WFSPTRCODELINEMAPPINGOUT, *LPWFSPTRCODELINEMAPPINGOUT;
```

#### wCodeLineFormat

Specifies the code-line format that is being reported.

## *lpxCharMapping*

Defines the mapping of the font specific symbols to byte values. These byte values are used to represent the font specific characters when the code line is read through the

WFS CMD PTR READ IMAGE command. The font specific meaning of each index is defined in the following tables:

## E13B

	Index	0	1	2	3	4	
	Symbol that byte value represents	1	u <sup>r</sup> .	II.	ш	N/A	
	Meaning	Transit	Amount	On Us	Dash	Reject / Unreadable	
CMC	27						
	Index	0	1	2	3	4	5
	Symbol	j <b>rj</b> il	udi	<b>!!</b> !!	<b>::</b> II	#N;	N/A
	Meaning	S1 - Start of Bank Account	S2 - Start of the Amount field	S3 - Terminate Routing	S4 - Unused	S5 - Transit / Routing	Reject / Unreadable

**Error Codes** 

Only the generic error codes defined in [Ref. 1] can be generated by this command.

Comments

None.

**Description** 

# 8. Execute Commands

## 8.1 WFS CMD PTR CONTROL MEDIA

This command is used to control a form drawn in by the device (e.g. after reading or in case of termination of an application request).

If an eject operation is specified, it completes when the media is moved to the exit slot. A service event is generated when the media has been taken by the user (only if field *bMediaTaken* defined in structure WFSPTRCAPS is equal to TRUE).

## Input Param LPDWORD lpdwMediaControl;

*lpdwMediaControl* 

Pointer to a value which specifies the manner in which the media should be handled, as a combination of the following bit-flags:

Value	Meaning
WFS_PTR_CTRLEJECT	Flush any data to the printer that has not yet been printed from previous WFS CMD PTR PRINT FORM or
	WFS_CMD_PTR_PRINT_RAW_FILE
WFS_PTR_CTRLPERFORATE	commands, then eject the media. Flush data as above, then perforate the media.
WFS_PTR_CTRLCUT	Flush data as above, then cut the media. For printers which have the ability to stack multiple cut sheets and deliver them as a single bundle to the customer, cut causes the media to be stacked and eject causes the bundle to be moved to the exit slot.
WFS_PTR_CTRLSKIP	Flush data as above, then skip the media to mark.
WFS_PTR_CTRLFLUSH	Flush any data to the printer that has not yet been physically printed from previous WFS_CMD_PTR_PRINT_FORM or WFS_CMD_PTR_PRINT_RAW_FILE
	commands. This will synchronize the application with the device to ensure that all data has been physically printed.
WFS_PTR_CTRLRETRACT	Flush data as above, then retract the media to retract bin number one, for devices with more than one bin the command WFS_CMD_PTR_RETRACT_MEDIA should be used if the media should be retracted to another bin than bin number one.
WFS_PTR_CTRLSTACK	Flush data as above, then move the media item on the internal stacker.
WFS_PTR_CTRLPARTIALCUT	Flush the data as above, then partially cut the
WFS_PTR_CTRLALARM	media.  Cause the printer to ring a bell, beep, or otherwise sound an audible alarm.
WFS_PTR_CTRLATPFORWARD	Flush the data as above, then turn one page
WFS_PTR_CTRLATPBACKWARD	forward. Flush the data as above, then turn one page
WFS_PTR_CTRLTURNMEDIA	backward.  Flush the data as above, then turn inserted media.
WFS_PTR_CTRLSTAMP	Flush the data as above, then stamp on
WFS_PTR_CTRLPARK	inserted media.  Park the media in the parking station.

WFS_PTR_CTRLEXPEL	Flush the data as above, then throw the media out of the exit slot.
WFS_PTR_CTRLEJECTTOTRANSPORT	Flush the data as above, then move the media to a position on the transport just behind the exit slot.
WFS_PTR_CTRLROTATE180	Flush the data as above, then rotate media 180 degrees in the printing plane.
WFS_PTR_CTRLCLEARBUFFER	Clear any data that has not yet been physically printed from previous WFS_CMD_PTR_PRINT_FORM or WFS_CMD_PTR_PRINT_RAW_FILE commands.

It is not possible to combine the flags WFS\_PTR\_CTRLEJECT, WFS\_PTR\_CTRLRETRACT, WFS\_PTR\_CTRLPARK, WFS\_PTR\_CTRLEXPEL and WFS\_PTR\_CTRLEJECTTOTRANSPORT with each other otherwise the command completes with WFS\_ERR\_INVALID\_DATA.

It is not possible to combine the flag WFS\_PTR\_CTRLCLEARBUFFER with any other flags, otherwise the command completes with WFS\_ERR\_INVALID\_DATA.

An application should be aware that the sequence of the actions is not guaranteed if more than one flag is specified in this parameter.

## **Output Param**

#### None.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_NOMEDIAPRESENT	The control action could not be completed because there is no media in the device, the media is not in a position where it can be controlled, or (in the case of WFS_PTR_CTRLRETRACT) has been removed.
WFS_ERR_PTR_FLUSHFAIL WFS_ERR_PTR_RETRACTBINFULL	The device was not able to flush data.  The retract bin is full. No more media can be retracted. The current media is still in the device.
WFS_ERR_PTR_STACKERFULL	The internal stacker is full. No more media can be moved to the stacker.
WFS ERR PTR PAGETURNFAIL	The device was not able to turn the page.
WFS_ERR_PTR_MEDIATURNFAIL	The device was not able to turn the inserted media.
WFS_ERR_PTR_SHUTTERFAIL	Open or close of the shutter failed due to manipulation or hardware error.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed; operator intervention is required.
WFS_ERR_PTR_PAPERJAMMED	The paper is jammed.
WFS_ERR_PTR_PAPEROUT	The paper supply is empty.
WFS_ERR_PTR_INKOUT	No stamping possible, stamping ink supply empty.
WFS_ERR_PTR_TONEROUT	Toner or ink supply is empty or printing contrast with ribbon is not sufficient.
WFS_ERR_PTR_SEQUENCEINVALID	Programming error. Invalid command sequence (e.g. WFS_PTR_CTRLPARK and the parking station is busy).
WFS_ERR_PTR_MEDIARETAINED	Media has been retracted in attempts to eject it. The device is clear and can be used.
WFS_ERR_PTR_BLACKMARK	Black mark detection has failed, nothing has been printed.

WFS\_ERR\_PTR\_MEDIARETRACTED Presented media was automatically retracted

before all wads could be presented and before the command could complete

The presented media has been automatically

retracted.

successfully.

**Events** In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_USRE_PTR_RETRACTBINTHRESHO	
	The retract bin is high or full; operator intervention is required. Note that this event is sent only once, at the point at which the
	bin becomes high or full. It is sent with WFS_PTR_RETRACTBINHIGH or WFS_PTR_RETRACTBINFULL status.
WFS SRVE PTR MEDIATAKEN	The media has been taken by the user.
WFS_USRE_PTR_PAPERTHRESHOLD	The paper supply is low or empty; operator
	intervention is required. Note that this event
	is sent only once, at the point at which the
	supply becomes low or empty. It is sent with
	WFS_PTR_PAPERLOW or
WEG LIGHE DED TONEDTHEEGIALD	WFS_PTR_PAPEROUT status.
WFS_USRE_PTR_TONERTHRESHOLD	The toner or ink supply is low or empty or
	the printing contrast with ribbon is weak or not sufficient; operator intervention is
	required. Note that this event is sent only
	once, at the point at which the supply
	becomes low or empty. It is sent with
	WFS_PTR_TONERLOW or
	WFS_PTR_TONEROUT status.
WFS_USRE_PTR_INKTHRESHOLD	The stamping ink supply is low or empty; operator intervention is required. Note that
	this event is sent only once, at the point at
	which the supply becomes low or empty. It
	is sent with WFS_PTR_INKLOW or
WEG EVEE DED LEEDLINGENEED	WFS_PTR_INKOUT status.
WFS_EXEE_PTR_MEDIAPRESENTED	Media has been presented for removal. See section 11 for further details.
WFS_SRVE_PTR_MEDIAAUTORETRACT	ED
	771 4 1 1 1 1 4 4 11 11

**Comments** None.

## 8.2 WFS CMD PTR PRINT FORM

## **Description**

This command is used to print a form by merging the supplied variable field data with the defined form and field data specified in the form. If no media is present, the device waits for the period of time specified by the *dwTimeOut* parameter in the **WFSExecute** call for media to be inserted from the external paper source.

## **Input Param**

## LPWFSPTRPRINTFORM lpPrintForm;

```
typedef struct _wfs_ptr_print_form
     LPSTR
                           lpszFormName;
     LPSTR
                           lpszMediaName;
     WORD
                           wAlignment;
     WORD
                            wOffsetX;
                           wOffsetY;
     WORD
     WORD
                            wResolution;
     DWORD
                            dwMediaControl;
                            lpszFields;
     LPSTR
     LPWSTR
                            lpszUNICODEFields;
     WORD
                            wPaperSource;
     } WFSPTRPRINTFORM, *LPWFSPTRPRINTFORM;
```

#### lpszFormName

Pointer to the null-terminated form name.

#### lpszMediaName

Pointer to the null-terminated media name. *lpszMediaName* is NULL if no media definition applies.

## wAlignment

Specifies the alignment of the form on the physical media, as one of the following values:

Value	Meaning
WFS_PTR_ALNUSEFORMDEFN	Use the alignment specified in the form
	definition.
WFS_PTR_ALNTOPLEFT	Align form to top left of physical media.
WFS_PTR_ALNTOPRIGHT	Align form to top right of physical media.
WFS_PTR_ALNBOTTOMLEFT	Align form to bottom left of physical media.
WFS_PTR_ALNBOTTOMRIGHT	Align form to bottom right of physical
	media.

## wOffsetX

Specifies the horizontal offset of the form, relative to the horizontal alignment specified in *wAlignment*, in horizontal resolution units (from form definition); always a positive number (i.e. if aligned to the right side of the media, means offset the form to the left). A value of WFS\_PTR\_OFFSETUSEFORMDEFN indicates that the *xoffset* value from the form definition should be used.

#### wOffset)

Specifies the vertical offset of the form, relative to the vertical alignment specified in *wAlignment*, in vertical resolution units (from form definition); always a positive number (i.e. if aligned to the bottom of the media, means offset the form upward). A value of

WFS\_PTR\_OFFSETUSEFORMDEFN indicates that the *yoffset* value from the form definition should be used.

## wResolution

Specifies the resolution in which to print the form. Possible values are:

Value	Meaning
WFS_PTR_RESLOW	Print form with low resolution.
WFS_PTR_RESMED	Print form with medium resolution.
WFS_PTR_RESHIGH	Print form with high resolution.
WFS_PTR_RESVERYHIGH	Print form with very high resolution.

## dwMediaControl

Specifies the manner in which the media should be handled after the printing is done, as a combination of the flags described under WFS\_CMD\_PTR\_CONTROL\_MEDIA. A zero value of this parameter means to do none of these actions, as when printing multiple forms on a single page. When zero is specified and the device does not support the WFS\_PTR\_CTRLFLUSH capability, the data will be printed immediately. If the device supports WFS\_PTR\_CTRLFLUSH, the data may be buffered and the WFS\_CMD\_PTR\_CONTROL\_MEDIA command should be used to synchronize the application with the device to ensure that all data has been physically printed. WFS\_PTR\_CTRLCLEARBUFFER is not applicable to this command, in this case WFS\_ERR\_INVALID\_DATA will be returned.

## lpszFields

Pointer to a series of "<FieldName>=<FieldValue>" strings, where each string is null-terminated with the entire field string terminating with two null characters. If the field is an index field, then the syntax of the string is instead "<FieldName>[<index>]=<FieldValue>", where <index> specifies the zero-based element of the index field.

## *lpszUNICODEFields*

Pointer to a series of "<FieldName>=<FieldValue>" UNICODE strings, where each string is null-terminated with the entire field string terminating with two null characters. If the field is an index field, then the syntax of the string is instead "<FieldName>[<index>]=<FieldValue>", where <index> specifies the zero-based element of the index field.

The *lpszUNICODEFields* field should only be used if the form is encoded in UNICODE representation. This can be determined with the WFS INF PTR QUERY FORM command.

## wPaperSource

Specifies the Paper source to use when printing this form. When the value is zero, then the paper source is determined from the media definition. This parameter is ignored if there is already paper in the print position. Possible values are:

Value	Meaning
WFS_PTR_PAPERANY	Any paper source can be used; it is
	determined by the service.
WFS_PTR_PAPERUPPER	Use the only paper source or the upper paper
	source, if there is more than one paper
	supply.
WFS_PTR_PAPERLOWER	Use the lower paper source.
WFS_PTR_PAPEREXTERNAL	Use the external paper source (such as
	envelope tray or single sheet feed).
WFS_PTR_PAPERAUX	Use the auxiliary paper source.
WFS_PTR_PAPERAUX2	Use the second auxiliary paper source.
WFS_PTR_PAPERPARK	Use the parking station.

## Output Param None.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_FORMNOTFOUND	The specified form definition cannot be
	found.
WFS_ERR_PTR_FLUSHFAIL	The device was not able to flush data.
WFS_ERR_PTR_MEDIAOVERFLOW	The form overflowed the media.
WFS_ERR_PTR_FIELDSPECFAILURE	The syntax of the <i>lpszFields</i> member is invalid.
WFS_ERR_PTR_FIELDERROR	An error occurred while processing a field, causing termination of the print request. An execute event WFS_EXEE_PTR_FIELDERROR is posted with the details.
WFS_ERR_PTR_MEDIANOTFOUND	The specified media definition cannot be found.
WFS_ERR_PTR_MEDIAINVALID WFS_ERR_PTR_FORMINVALID	The specified media definition is invalid. The specified form definition is invalid.

retracted. The curren	ll. No more media can be nt media is still in the
device.	
WFS_ERR_PTR_STACKERFULL The internal stacker can be moved to the	is full. No more media
WFS ERR PTR PAGETURNFAIL The device was not a	able to turn the page.
WFS_ERR_PTR_MEDIATURNFAIL The device was not a media.	able to turn the inserted
WFS_ERR_PTR_SHUTTERFAIL Open or close of the manipulation or hard	shutter failed due to dware error.
WFS_ERR_PTR_MEDIAJAMMED  The media is jamme is required.	ed; operator intervention
WFS_ERR_PTR_CHARSETDATA Character set(s) supprovider is inconsist	tent with use of
WFS_ERR_PTR_PAPERJAMMED The paper is jammed	<i>NICODEFields</i> fields.
WFS_ERR_PTR_PAPEROUT The paper is juillined.	
	le, stamping ink supply
WFS_ERR_PTR_TONEROUT Toner or ink supply contrast with ribbon	
WFS_ERR_PTR_SEQUENCEINVALID Programming error. sequence (e.g. dwMe	Invalid command
	ARK and park position
WFS_ERR_PTR_SOURCEINVALID The selected paper s	source is not supported
by the hardware.  WFS_ERR_PTR_MEDIARETAINED Media has been retra	acted in attempts to eject
it. The device is clear

magnetic stripe data	
	found; media may have
	led through the wrong
a addition to the generic events defined in [Ref. 1], the following events	can be generated by this

## **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS EXEE PTR NOMEDIA	No media is present in the device.
WFS_EXEE_PTR_MEDIAINSERTED	Media has been inserted into the device.
WFS_EXEE_PTR_FIELDERROR	A fatal error occurred while processing a
	field.
WFS_EXEE_PTR_FIELDWARNING	A non-fatal error occurred while processing
	a field.

WFS USRE PTR RETRACTBINTHRESHOLD

WFS SRVE PTR MEDIATAKEN

WFS USRE PTR PAPERTHRESHOLD

The retract bin is full; operator intervention is required. Note that this event is sent only once, at the point at which the bin becomes

full. It is sent with

WFS\_PTR\_RETRACTBINFULL or WFS\_PTR\_RETRACTBINHIGH status. The media has been taken by the user. The paper supply is low or empty; operator

intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with

WFS\_PTR\_PAPERLOW or WFS\_PTR\_PAPEROUT status.

WFS\_USRE\_PTR\_TONERTHRESHOLD The toner or ink supply is low or empty or

the printing contrast with ribbon is weak or not sufficient; operator intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with WFS PTR TONERLOW or

WFS\_PTR\_TONERLOW or WFS\_PTR\_TONEROUT status.

WFS\_USRE\_PTR\_INKTHRESHOLD The stamping ink supply is low or empty;

operator intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with WFS PTR INKLOW or

WFS PTR INKOUT status.

WFS\_EXEE\_PTR\_MEDIAPRESENTED Media has been presented for removal. See

section 11 for further details.

WFS\_EXEE\_PTR\_MEDIAREJECTED The media has been rejected and presented

back to the user. It is available at the entry/exit slot. When the media is removed, a WFS\_SRVE\_PTR\_MEDIATAKEN event

will be sent.

WFS SRVE PTR MEDIAAUTORETRACTED

The presented media has been automatically retracted.

Comments

All error codes (except WFS\_ERR\_PTR\_NOMEDIAPRESENT) and events listed under the WFS\_CMD\_PTR\_CONTROL\_MEDIA command description can also occur on this command.

An invalid field name is treated as a WFS\_EXEE\_PTR\_FIELDWARNING event with WFS\_PTR\_FIELDNOTFOUND status. A WFS\_EXEE\_PTR\_FIELDWARNING event is returned with WFS\_PTR\_FIELDOVERFLOW status if the data overflows the field, and the field definition OVERFLOW value is TRUNCATE, BESTFIT, OVERWRITE or WORDWRAP. Other field-related problems generate a field error return and event.

The application will use *lpszFields* or *lpszUNICODEFields* as an input parameter, depending upon the Service Provider capabilities. Legacy (non-UNICODE aware) applications will only use the *lpszFields* field. UNICODE applications can use either the *lpszFields* or *lpszUNICODEFields* fields, provided the Service Provider is UNICODE compliant.

#### 8.3 WFS CMD PTR READ FORM

## **Description**

This command is used to read data from input fields on the specified form. These input fields may consist of MICR, OCR, MSF, BARCODE, or PAGEMARK input fields. These input fields may also consist of TEXT fields for purposes of detecting available passbook print lines with passbook printers supporting such capability. If no media is present, the device waits for the period of time specified by the dwTimeOut parameter in the WFSExecute call for media to be inserted.

## **Input Param**

## LPWFSPTRREADFORM lpReadForm;

```
typedef struct _wfs_ptr_read_form
     LPSTR
                           lpszFormName:
     LPSTR
                           lpszFieldNames;
     LPSTR
                           lpszMediaName;
     DWORD
                           dwMediaControl;
     } WFSPTRREADFORM, *LPWFSPTRREADFORM;
```

### lpszFormName

Pointer to the null-terminated name of the form.

#### lpszFieldNames

Pointer to a list of null-terminated field names from which to read input data, with the final name terminating with two null characters. If this value is NULL, then read data from all input fields on the form.

#### lpszMediaName

Pointer to the null-terminated media name. *lpszMediaName* is NULL if no media definition applies.

#### dwMediaControl

Specifies the manner in which the media should be handled after the reading was done and can be a combination of the flags described under WFS CMD PTR CONTROL MEDIA.

WFS PTR CTRLCLEARBUFFER is not applicable to this command, in this case WFS ERR INVALID DATA will be returned.

## Output Param LPWFSPTRREADFORMOUT lpReadFormOut;

```
typedef struct _wfs_ptr_read_form_out
     LPSTR
                           lpszFields;
     LPWSTR
                           lpszUNICODEFields;
     } WFSPTRREADFORMOUT, *LPWFSPTRREADFORMOUT;
```

## *lpszFields*

Pointer to a series of "<FieldName>=<FieldValue>" strings, where each string is null-terminated with the entire field string terminating with two null characters. If the field is an index field, then the syntax of the string is instead "<FieldName>[<index>]=<FieldValue>", where <index> specifies the zero-based element of the index field. An empty list may be indicated by either a NULL pointer or a pointer to two consecutive null characters.

## lpszUNICODEFields

Pointer to a series of "<FieldName>=<FieldValue>" UNICODE strings, where each string is nullterminated with the entire field string terminating with two null characters. If the field is an index field, then the syntax of the string is instead "<FieldName>[<index>]=<FieldValue>", where <index> specifies the zero-based element of the index field. An empty list may be indicated by either a NULL pointer or a pointer to two consecutive null characters.

### **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_FORMNOTFOUND	The specified form cannot be found.
WFS_ERR_PTR_READNOTSUPPORTED	The device has no read capability.
WFS_ERR_PTR_FIELDSPECFAILURE	The syntax of the <i>lpszFieldNames</i> member is
	invalid.

WFS_ERR_PTR_FIELDERROR	An error occurred while processing a field, causing termination of the print request. An execute event WFS_EXEE_PTR_FIELDERROR is posted with the details.
WFS_ERR_PTR_MEDIANOTFOUND	The specified media definition cannot be found.
WFS_ERR_PTR_MEDIAINVALID	The specified media definition is invalid.
WFS_ERR_PTR_FORMINVALID	The specified form definition is invalid.
WFS_ERR_PTR_MEDIASKEWED	The media skew exceeded the limit in the form definition.
WFS_ERR_PTR_RETRACTBINFULL	The retract bin is full. No more media can be retracted. The current media is still in the device.
WFS_ERR_PTR_SHUTTERFAIL	Open or close of the shutter failed due to manipulation or hardware error.
WFS ERR PTR MEDIAJAMMED	The media is jammed.
WFS_ERR_PTR_INKOUT	No stamping possible, stamping ink supply empty.
WFS ERR PTR LAMPINOP	Imaging lamp is inoperative.
WFS ERR PTR SEQUENCEINVALID	Programming error. Invalid command
	sequence (e.g. dwMediaControl =
	WFS_PTR_CTRLPARK and park position
	is busy).
WFS_ERR_PTR_MEDIASIZE	The media entered has an incorrect size.
WFS_ERR_PTR_MEDIAREJECTED	The media was rejected during the insertion phase. The
	WFS_EXEE_PTR_MEDIAREJECTED
	execute event is posted with the details. The
	device is still operational.
WFS_ERR_PTR_MSFERROR	The MSF read operation specified by the
	forms definition could not be completed
	successfully due to invalid magnetic stripe
WES EDD DTD NOMSE	data.
WFS_ERR_PTR_NOMSF	No magnetic stripe found; media may have been inserted or pulled through the wrong
	way.
1111	

**Events** 

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_EXEE PTR_NOMEDIA	No media is present in the device.
WFS_EXEE_PTR_MEDIAINSERTED	Media has been inserted into the device.
WFS_EXEE_PTR_FIELDERROR	A fatal error occurred while processing a field.
WFS_EXEE_PTR_FIELDWARNING	A non-fatal error occurred while processing a field.
WFS_USRE_PTR_RETRACTBINTHRESHO	LD
WFS_SRVE_PTR_MEDIATAKEN WFS_USRE_PTR_INKTHRESHOLD	The retract bin is full; operator intervention is required. Note that this event is sent only once, at the point at which the bin becomes full. It is sent with WFS_PTR_RETRACTBINFULL or WFS_PTR_RETRACTBINHIGH status. The media has been taken by the user. The stamping ink supply is low or empty; operator intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with WFS_PTR_INKLOW or WFS_PTR_INKOUT status.

WFS USRE PTR LAMPTHRESHOLD The imaging lamp is fading or inoperative;

operator intervention is required. Note that this event is sent only once, at the point at which the threshold is reached. It is sent with

WFS\_PTR\_LAMPFADING or WFS\_PTR\_LAMPINOP status.

WFS\_EXEE\_PTR\_MEDIAREJECTED The media has been rejected and presented

back to the user. It is available at the entry/exit slot. When the media is removed, a WFS\_SRVE\_PTR\_MEDIATAKEN event

will be sent.

**Comments** 

All error codes (except WFS\_ERR\_PTR\_NOMEDIAPRESENT) and events listed under the WFS\_CMD\_PTR\_CONTROL\_MEDIA command description can also occur on this command.

The application will use *lpszFieldNames* as an input parameter. The Service Provider will return the data in *lpszUNICODEFields* or *lpszFields* depending on the capabilities of the Service Provider and form definition.

For passbook usage of the *lpszFields* and *lpszUNICODEFields* fields the following applies:

If the media type is PASSBOOK, and the field(s) type is TEXT, and the Service Provider and the underlying passbook printer are capable of detecting available passbook print lines, then the field(s) will be returned without a value, in the format "<FieldName>" or "<FieldName>[<index>]", if the field is available for passbook printing. Field(s) unavailable for passbook printing will not be returned. The Service Provider will examine the passbook text field(s) supplied in the *lpszFieldNames* string, and with the form/fields definition and the underlying passbook printer capability determine which fields should be available for passbook printing.

To illustrate when media type is PASSBOOK, if a form named PSBKTST1 contains 24 fields, one field per line, and the field names are LINE1 through LINE24 (same order as printing), and after execution of this command *lpszFields* contains fields LINE13 through LINE24, then the first print line available for passbook printing is line 13.

To illustrate another example when media type is PASSBOOK, if a form named PSBKTST2 contains 24 fields, one field per line, and the field names are LINE1 through LINE24 (same order as printing), and after execution of this command *lpszFields* contains fields LINE13, and LINE20 through LINE24 then the first print line available for passbook printing is line 13, however lines 14-19 are <u>not</u> also available, so if the application is attempting to determine the first available print line after which all subsequent print lines are also available then line 20 is a better choice.

# WFS\_CMD\_PTR\_RAW\_DATA

## **Description**

This command is used to send raw data (a byte string of device dependent data) to the physical

#### **Input Param**

## LPWFSPTRRAWDATA lpRawData;

```
typedef struct _wfs_ptr_raw_data
     WORD
                           wInputData;
     ULONG
                           ulSize;
     LPBYTE
                           lpbData;
     } WFSPTRRAWDATA, *LPWFSPTRRAWDATA;
```

## wInputData

Specifies that input data from the device is expected in response to sending the raw data (i.e. the data contains a command requesting data). Possible values are:

Value	Meaning
WFS_PTR_NOINPUTDATA	No input data is expected.
WFS_PTR_INPUTDATA	Input data is expected.

ulSize

Specifies the size of the byte string passed to the device.

Points to the byte string holding the device dependent data.

## Output Param LPWFSPTRRAWDATAIN lpRawDataIn;

[used only if wInputData is set to WFS PTR INPUTDATA]

```
typedef struct _wfs_ptr_raw_data_in
     ULONG
                           ulSize;
     LPBYTE
                           lpbData;
     } WFSPTRRAWDATAIN, *LPWFSPTRRAWDATAIN;
```

Specifies the size of the byte string received from the device.

lpbData

Points to the byte string received from the device.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_SHUTTERFAIL	Open or close of the shutter failed due to
	manipulation or hardware error.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed.
WFS_ERR_PTR_PAPERJAMMED	The paper is jammed.
WFS_ERR_PTR_PAPEROUT	The paper supply is empty.
WFS_ERR_PTR_TONEROUT	Toner or ink supply is empty or printing contrast with ribbon is not sufficient.
WFS_ERR_PTR_MEDIARETAINED	Media has been retracted in attempts to eject it. The device is clear and can be used.
WFS_ERR_PTR_BLACKMARK	Black mark detection has failed, nothing has been printed.
WFS_ERR_PTR_MEDIARETRACTED	Presented media was automatically retracted before all wads could be presented and before the command could complete successfully.

#### **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_USRE_PTR_RETRACTBINTHRESHO	DLD
	The retract bin is full or high; operator intervention is required. Note that this event is sent only once, at the point at which the bin becomes full or high. It is sent with WFS_PTR_RETRACTBINFULL or WFS_PTR_RETRACTBINHIGH status.
WFS SRVE PTR MEDIATAKEN	The media has been taken by the user.
WFS_USRE_PTR_PAPERTHRESHOLD	The paper supply is low or empty; operator intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with WFS_PTR_PAPERLOW or
WEC LICHE DED TOMEDELIDECTION	WFS_PTR_PAPEROUT status.
WFS_USRE_PTR_TONERTHRESHOLD	The toner or ink supply is low or empty or the printing contrast with ribbon is weak or not sufficient; operator intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with WFS_PTR_TONERLOW or WFS_PTR_TONEROUT status.
WFS_EXEE_PTR_MEDIAPRESENTED	Media has been presented for removal. See section 11 for further details.
WFS_SRVE_PTR_MEDIAAUTORETRACT	
	The presented media has been automatically retracted.
Applications which send raw data to a device will	typically not be device or vendor independent.

## **Comments**

Applications which send raw data to a device will typically not be device or vendor independent. Problems with the use of this command include:

- 1. The data sent to the device can include commands that change the state of the device in unpredictable ways (in particular, in ways that the Service Provider may not be aware of).
- 2. Usage of this command will not be portable.
- 3. This command violates the XFS forms model that is the basis of XFS printer access.

Thus usage of this command should be avoided whenever possible. If it is used, the usage should be carefully isolated from all other XFS access to the service by at least the **WFSLock** and **WFSUnlock** commands.

## WFS\_CMD\_PTR\_MEDIA\_EXTENTS

## **Description**

This command is used to get the extents of the media inserted in the physical device. The input parameter specifies the base unit and fractions in which the media extent values will be returned. If no media is present, the device waits for the period of time specified by the dwTimeOut parameter in the **WFSExecute** call for media to be inserted.

## **Input Param**

## LPWFSPTRMEDIAUNIT lpMediaUnit:

```
typedef struct _wfs_ptr_media_unit
     WORD
                           wBase;
     WORD
                           wUnitX;
     WORD
                           wUnitY:
     } WFSPTRMEDIAUNIT, *LPWFSPTRMEDIAUNIT;
```

#### wBase

Specifies the base unit of measurement of the media and can be one of the following values:

Value	Meaning
WFS_FRM_INCH	The base unit is inches.
WFS_FRM_MM	The base unit is millimeters.
WFS_FRM_ROWCOLUMN	The base unit is rows and columns.

### wUnitX

Specifies the horizontal resolution of the base units as a fraction of the wBase value. For example, a value of 16 applied to the base unit WFS FRM INCH means that the base horizontal resolution is 1/16".

wUnitY

Specifies the vertical resolution of the base units as a fraction of the wBase value. For example, a value of 10 applied to the base unit WFS FRM MM means that the base vertical resolution is 0.1

## Output Param LPWFSPTRMEDIAEXT lpMediaExt;

```
typedef struct wfs ptr media ext
     ULONG
                           ulSizeX;
     ULONG
                           ulSizeY:
     } WFSPTRMEDIAEXT, *LPWFSPTRMEDIAEXT;
```

Specifies the width of the media in terms of the base horizontal resolution.

Specifies the height of the media in terms of the base vertical resolution.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_EXTENTNOTSUPPORTED	The device cannot report extent(s).
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed.
WFS_ERR_PTR_LAMPINOP	Imaging lamp is inoperative.
WFS_ERR_PTR_MEDIASIZE	The media entered has an incorrect size and
	the media remains inside the device.
WFS_ERR_PTR_MEDIAREJECTED	The media was rejected during the insertion
	phase. The
	WFS_EXEE_PTR_MEDIAREJECTED
	execute event is posted with the details. The
	device is still operational.

### **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_EXEE_PTR_NOMEDIA	No media is present in the device.
WFS_EXEE_PTR_MEDIAINSERTED	Media has been inserted into the device.

## CWA 16926-3:2022 (E)

WFS\_EXEE\_PTR\_MEDIAREJECTED The media has been rejected and presented

back to the user. It is available at the

entry/exit slot. When the media is removed, a WFS SRVE PTR MEDIATAKEN event

will be sent.

WFS\_SRVE\_PTR\_MEDIATAKEN The media has been taken by the user.

Comments None.

# 8.6 WFS\_CMD\_PTR\_RESET\_COUNT

**Description** This function resets the present value for number of media items retracted to zero. The function is

possible only for printers with retract capability.

The number of media items retracted is controlled by the service and can be requested before

resetting via the info command WFS\_INF\_PTR\_STATUS.

Input Param LPUSHORT lpusBinNumber;

lpusBinNumber

Pointer to the number of the retract bin for which the retract count should be reset to zero. This number has to be between one and the number of bins on the device. If this pointer is NULL all

bins will be set to zero.

Output Param None.

**Error Codes** Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Events** In addition to the generic events defined in [Ref. 1], the following events can be generated by this

command:

Value Meaning

WFS USRE PTR RETRACTBINTHRESHOLD

The status of the retract bin has changed from high or full to a good state. The event is sent with WFS\_PTR\_RETRACTBINOK

status.

**Comments** None.

## 8.7 WFS\_CMD\_PTR\_READ\_IMAGE

## **Description**

This function returns image data from the current media. If no media is present, the device waits for the period of time specified by the *dwTimeOut* parameter in the **WFSExecute** call for media to be inserted.

## **Input Param**

## LPWFSPTRIMAGEREQUEST lpImageRequest;

```
typedef struct _wfs_ptr_image_request
     WORD
                           wFrontImageType;
     WORD
                           wBackImageType;
     WORD
                           wFrontImageColorFormat;
     WORD
                           wBackImageColorFormat;
     WORD
                           wCodelineFormat;
     WORD
                           fwImageSource;
     LPSTR
                           lpszFrontImageFile;
                           lpszBackImageFile;
     LPSTR
     } WFSPTRIMAGEREQUEST,
                            *LPWFSPTRIMAGEREQUEST;
```

## wFrontImageType

Specifies the format of the front image returned by this command as one of the following flags (zero if source not selected):

Value	Meaning
WFS_PTR_IMAGETIF	The returned image is in TIF 6.0 format.
WFS_PTR_IMAGEWMF	The returned image is in WMF (Windows
	Metafile) format.
WFS_PTR_IMAGEBMP	The returned image is in BMP format.
WFS_PTR_IMAGEJPG	The returned image is in JPG format.

## wBackImageTvpe

Specifies the format of the back image returned by this command as one of the following flags (zero if source not selected):

Value	Meaning
WFS PTR IMAGETIF	The returned image is in TIF 6.0 format.
WFS_PTR_IMAGEWMF	The returned image is in WMF (Windows
	Metafile) format.
WFS_PTR_IMAGEBMP	The returned image is in BMP format.
WFS_PTR_IMAGEJPG	The returned image is in JPG format.

## wFrontImageColorFormat

Specifies the color format of the requested front image as one of the following flags (zero if source not selected):

Meaning
The scanned images has to be returned in
binary (image contains two colors, usually
the colors black and white).
The scanned images has to be returned in
gray scale (image contains multiple gray colors).
The scanned images has to be returned in
full color (image contains colors like red, green, blue etc.).

## wBackImageColorFormat

Specifies the color format of the requested back image as one of the following flags (zero if source not selected):

Value	Meaning
WFS_PTR_IMAGECOLORBINARY	The scanned images has to be returned in binary (image contains two colors, usually the colors black and white).

WFS_PTR_IMAGECOLORGRAYSCALE	The scanned images has to be returned in gray scale (image contains multiple gray colors).
WFS_PTR_IMAGECOLORFULL	The scanned images has to be returned in full color (image contains colors like red, green, blue etc.).

#### wCodelineFormat

Specifies the code line (MICR data) format, as one of the following flags (zero if source not selected):

Value	Meaning
WFS_PTR_CODELINECMC7	Read CMC7 code line.
WFS_PTR_CODELINEE13B	Read E13B code line.
WFS_PTR_CODELINEOCR	Read code line using OCR.

#### *fwImageSource*

Specifies the source as a combination of the following flags:

Value	Meaning
WFS_PTR_IMAGEFRONT	The front image of the document is requested.
WFS_PTR_IMAGEBACK	The back image of the document is requested.
WFS PTR CODELINE	The code line of the document is requested.
WFS_PTR_PASSPORT_DG1_RFID	Data Group 1 from a passport using RFID is requested [Ref. 2].
WFS_PTR_PASSPORT_DG2_RFID	Data Group 2 from a passport using RFID is requested [Ref. 2].

## lpszFrontImageFile

File specifying where to store the front image, e.g. "C:\Temp\FrontImage.bmp". If a NULL pointer is supplied then the front image data will be returned in the output parameter. This value is terminated with a single null character and cannot contain UNICODE characters.

To reduce the size of data sent between the Application and the Service Provider it is recommended to make use of this parameter.

## lpszBackImageFile

File specifying where to store the back image, e.g. "C:\Temp\BackImage.bmp". If a NULL pointer is supplied then the back image data will be returned in the output structure. This value is terminated with a single null character and cannot contain UNICODE characters.

To reduce the size of data sent between the application and the Service Provider it is recommended to make use of this parameter.

## **Output Param**

## LPWFSPTRIMAGE \*lppImage;

Pointer to a NULL-terminated array of pointers to WFSPTRIMAGE structures, one array element for each image source requested.

## wImageSource

Specifies the source of the data returned by this command as one of the following flags:

Value	Meaning
WFS_PTR_IMAGEFRONT	The front image of the document.
WFS_PTR_IMAGEBACK	The back image of the document.
WFS_PTR_CODELINE	The code line of the document.
WFS_PTR_PASSPORT_DG1_RFID	The data contains Data Group 1 from a
	passport using RFID.

WFS PTR PASSPORT DG2 RFID

The data contains Data Group 2 from a passport using RFID.

#### wStatus

Status of reading the image data. Possible values are:

Value	Meaning
WFS_PTR_DATAOK	The data is OK.
WFS_PTR_DATASRCNOTSUPP	The data source to read from is not
	supported by the Service Provider.
WFS_PTR_DATASRCMISSING	The data source to read from is missing, e.g.
	the Service Provider is unable to get the code
	line.

## ulDataLength

Count of bytes of the following *lpbData*. Zero if the image source is WFS\_PTR\_IMAGEFRONT or WFS\_PTR\_IMAGEBACK and the image data has been stored to the hard disk (file name provided).

### lpbData

Points to the data. NULL pointer if the image source is WFS\_PTR\_IMAGEFRONT or WFS\_PTR\_IMAGEBACK and the image data has been stored to the hard disk (file name provided).

If the image source is WFS\_PTR\_CODELINE, *lpbData* contains characters in the ASCII range. If the code line was read using the OCR-A font then the ASCII codes will conform to Figure E1 in ANSI X3.17-1981. If the code line was read using the OCR-B font then the ASCII codes will conform to Figure C2 in ANSI X3.49-1975. In both these cases unrecognized characters will be reported as the REJECT code, 0x1A. The E13B and CMC7 fonts use the ASCII equivalents for the standard characters and use the byte values as reported by the

WFS\_INF\_PTR\_CODELINE\_MAPPING command for the symbols that are unique to MICR fonts.

If the image source is WFS\_PTR\_PASSPORT\_DG1\_RFID or

WFS PTR PASSPORT DG1 RFID, contains the associated fields as defined in [Ref. 2].

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_SHUTTERFAIL	Open or close of the shutter failed due to
	manipulation or hardware error.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed; operator intervention
	is required.
WFS_ERR_PTR_FILE_IO_ERROR	Directory does not exist or a file I/O error
	occurred while storing the image to the hard
	disk.
WFS_ERR_PTR_LAMPINOP	Imaging lamp is inoperative.
WFS_ERR_PTR_MEDIASIZE	The media entered has an incorrect size and
	the media remains inside the device.
WFS_ERR_PTR_MEDIAREJECTED	The media was rejected during the insertion
	phase. The
	WFS_EXEE_PTR_MEDIAREJECTED
	execute event is posted with the details. The
	device is still operational.

## **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS EXEE PTR NOMEDIA	No media is present in the device.
WFS EXEE PTR MEDIAINSERTED	Media has been inserted into the device.
WFS SRVE PTR MEDIATAKEN	The media has been taken by the user.

## CWA 16926-3:2022 (E)

WFS USRE PTR LAMPTHRESHOLD The imaging lamp is fading or inoperative;

operator intervention is required. Note that this event is sent only once, at the point at which the threshold is reached. It is sent with

WFS\_PTR\_LAMPFADING or WFS\_PTR\_LAMPINOP status.

WFS EXEE PTR MEDIAREJECTED The media

The media has been rejected and presented back to the user. It is available at the entry/exit slot. When the media is removed, a WFS\_SRVE\_PTR\_MEDIATAKEN event

will be sent.

WFS SRVE PTR MEDIAAUTORETRACTED

The presented media has been automatically retracted.

#### **Comments**

If the returned image data is in Windows bitmap format (BMP) and a file path for storing the image is not supplied, then the first byte of data will be the start of the Bitmap Info Header (this bitmap format is known as DIB, Device Independent Bitmap). The Bitmap File Info Header, which is only present in file versions of bitmaps, will NOT be returned. If the returned image data is in bitmap format (BMP) and a file path for storing the image is supplied, then the first byte of data in the stored file will be the Bitmap File Info Header.

#### WFS\_CMD\_PTR\_RESET 8.8

## **Description**

This command is used by the application to perform a hardware reset which will attempt to return the PTR device to a known good state. This command does not over-ride a lock obtained on another application or service handle.

The device will attempt to retract or eject any items found anywhere within the device. This may not always be possible because of hardware problems. The

WFS SRVE PTR MEDIADETECTED event will inform the application where items were actually moved to.

## **Input Param**

## LPWFSPTRRESET lpReset;

Specifies where media should be moved to that is found in the device. If the application does not wish to specify a position it can set *lpReset* to NULL. In this case the Service Provider will determine where to move any items found.

```
typedef struct wfs ptr reset
     DWORD
                          dwMediaControl;
     USHORT
                          usRetractBinNumber;
     } WFSPTRRESET, *LPWFSPTRRESET;
```

## *dwMediaControl*

Specifies the manner in which the media should be handled, as one of the following bit-flags:

Value	Meaning
WFS PTR CTRLEJECT	Eject the media.
WFS_PTR_CTRLRETRACT	Retract the media to retract bin as specified
	in usRetractBinNumber.
WFS PTR CTRLEXPEL	Throw the media out of the exit slot.

### usRetractBinNumber

Number of the retract bin the media is retracted to. This number has to be between one and the number of bins supported by this device. It is only relevant if dwMediaControl equals WFS PTR CTRLRETRACT.

## Output Param None.

#### **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_SHUTTERFAIL	Open or close of the shutter failed due to manipulation or hardware error.
WFS_ERR_PTR_RETRACTBINFULL	The retract bin is full; no more media can be retracted. The current media is still in the device.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed; operator intervention is required.
WFS_ERR_PTR_PAPERJAMMED	The paper is jammed.

## **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_SRVE_PTR_MEDIADETECTED	A media is detected in the device during a
	reset operation.
WFS_USRE_PTR_RETRACTBINTHRESHOI	LD
	The retract bin is full or high; operator
	intervention is required. Note that this event
	is sent only once, at the point at which the
	bin becomes full or high. It is sent with
	WFS PTR RETRACTBINFULL or
	WFS_PTR_RETRACTBINHIGH status.
WEG COME DED MEDIA ALITODEED ACTE	D

WFS SRVE PTR MEDIAAUTORETRACTED

The presented media has been automatically retracted.

## CWA 16926-3:2022 (E)

WFS\_EXEE\_PTR\_MEDIAPRESENTED

Media has been presented for removal. See

section 11 for further details.

Comments

This command is used by an application control program to cause a device to reset itself to a known good condition.

## 8.9 WFS\_CMD\_PTR\_RETRACT\_MEDIA

**Description** The media is removed from its present position (media inserted into device, media entering,

unknown position) and stored in one of the retract bins. An event is sent if the storage capacity of the specified retract bin is reached. If the bin is already full and the command cannot be executed,

an error is returned and the media remains in its present position.

Input Param LPUSHORT lpusBinNumber;

lpusBinNumber

Pointer to the number of one of the retract bins. This number has to be between one and the number of bins supported by this device. If *lpusBinNumber* points to a zero value, the media will be retracted to the transport. After it has been retracted to the transport, in a subsequent operation

the media can be ejected again, or retracted to one of the retract bins.

Output Param LPUSHORT lpusBinNumber;

lpusBinNumber

Pointer to the number of the retract bin where the media has actually been deposited.

**Error Codes** In addition to the generic error codes defined in [Ref. 1], the following error codes can be

generated by this command:

Value	Meaning
WFS_ERR_PTR_NOMEDIAPRESENT	No media present on retract. Either there was no media present (in a position to be retracted from) when the command was called or the media was removed during the retract.
WFS_ERR_PTR_RETRACTBINFULL	The retract bin is full; no more media can be retracted. The current media is still in the device.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed; operator intervention is required.

**Events** 

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value

WFS USRE PTR RETRACTBINTHRESHOLD

The retract bin is full; operator intervention is required. Note that this event is sent only once, at the point at which the bin becomes

full. It is sent with

Meaning

WFS\_PTR\_RETRACTBINFULL or WFS\_PTR\_RETRACTBINHIGH status.

**Comments** If a retract request is received for a device with no retract capability, the

WFS ERR UNSUPP COMMAND error is returned.

#### 61

## 8.10 WFS\_CMD\_PTR\_DISPENSE\_PAPER

**Description** This command is used to move paper (which can also be a new passbook) from a paper source

into the print position.

Input Param LPWORD lpwPaperSource;

lpwPaperSource

Pointer to the paper source to dispense from. Possible values are:

Value	Meaning
WFS_PTR_PAPERANY	Any paper source can be used; it is
	determined by the service.
WFS_PTR_PAPERUPPER	Use the only paper source or the upper paper
	source, if there is more than one paper
	supply.
WFS_PTR_PAPERLOWER	Use the lower paper source.
WFS_PTR_PAPEREXTERNAL	Use the external paper.
WFS_PTR_PAPERAUX	Use the auxiliary paper source.
WFS_PTR_PAPERAUX2	Use the second auxiliary paper source.
WFS_PTR_PAPERPARK	Use the parking station paper source.

## Output Param None.

**Error Codes** 

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_PAPERJAMMED	The paper is jammed.
WFS_ERR_PTR_PAPEROUT	The paper supply is empty.
WFS_ERR_PTR_SEQUENCEINVALID	Programming error. Invalid command
	sequence (e.g. there is already media in the print position).
WFS_ERR_PTR_SOURCEINVALID	The selected paper source is not supported by the hardware.
WFS_ERR_PTR_MEDIARETRACTED	Presented media was automatically retracted before all wads could be presented and before the command could complete successfully.

**Events** 

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Meaning
The paper supply is low or empty; operator intervention is required. Note that this event
is sent only once, at the point at which the
supply becomes low or empty. It is sent with
WFS PTR PAPERLOW or
WFS PTR PAPEROUT status.
Media has been presented for removal. See section 11 for further details.
D

The presented media has been automatically retracted.

**Comments** None.

## 8.11 WFS\_CMD\_PTR\_SET\_GUIDANCE\_LIGHT

## **Description**

This command is used to set the status of the PTR guidance lights. This includes defining the flash rate, the color and the direction. When an application tries to use a color or direction that is not supported then the Service Provider will return the generic error WFS ERR UNSUPP DATA.

## **Input Param**

## LPWFSPTRSETGUIDLIGHT lpSetGuidLight;

## wGuidLight

Specifies the index of the guidance light to set as one of the values defined within the capabilities section.

#### **dwCommand**

Specifies the state of the guidance light indicator as WFS\_PTR\_GUIDANCE\_OFF or a combination of the following flags consisting of one type B, optionally one type C, and optionally one type D. If no value of type C is specified then the default color is used. The Service Provider determines which color is used as the default color.

Value	Meaning	Type
WFS_PTR_GUIDANCE_OFF	The light indicator is turned off.	A
WFS_PTR_GUIDANCE_SLOW_FLASH	The light indicator is set to	В
	flash slowly.	
WFS_PTR_GUIDANCE_MEDIUM_FLASH	The light indicator is set to	В
	flash medium frequency.	
WFS_PTR_GUIDANCE_QUICK_FLASH	The light indicator is set to	В
	flash quickly.	
WFS_PTR_GUIDANCE_CONTINUOUS	The light indicator is turned	В
	on continuously (steady).	
WFS_PTR_GUIDANCE_RED	The light indicator	C
	color is set to red.	
WFS_PTR_GUIDANCE_GREEN	The light indicator	C
	color is set to green.	
WFS_PTR_GUIDANCE_YELLOW	The light indicator	C
	color is set to yellow.	
WFS_PTR_GUIDANCE_BLUE	The light indicator	C
	color is set to blue.	~
WFS_PTR_GUIDANCE_CYAN	The light indicator	С
WEG PER CHIP INCE MACENER	color is set to cyan.	
WFS_PTR_GUIDANCE_MAGENTA	The light indicator	С
WEG DED CHIDANCE WHITE	color is set to magenta.	
WFS_PTR_GUIDANCE_WHITE	The light indicator	C
WEG DED CHIDANCE ENERN	color is set to white.	Б
WFS_PTR_GUIDANCE_ENTRY	The light indicator is set	D
WEG DTD CHIDANCE EVIT	to the entry state.	D
WFS_PTR_GUIDANCE_EXIT	The light indicator is set	D
	to the exit state.	

## Output Param None.

**Error Codes** 

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_INVALID_PORT	An attempt to set a guidance light to a new value was invalid because the guidance light does not exist.

**Events** 

Only the generic events defined in [Ref. 1] can be generated by this command.

Comments

Guidance light support was added into the PTR primarily to support guidance lights for

## CWA 16926-3:2022 (E)

workstations where more than one instance of a PTR is present. The original SIU guidance light mechanism was not able to manage guidance lights for workstations with multiple PTRs. This command can also be used to set the status of the PTR guidance lights when only one instance of a PTR is present.

The slow and medium flash rates must not be greater than 2.0 Hz. It should be noted that in order to comply with American Disabilities Act guidelines only a slow or medium flash rate must be used

## 8.12 WFS\_CMD\_PTR\_PRINT\_RAW\_FILE

## **Description**

This command is used to print a file that contains a complete print job in the native printer language. This file will have been created through the Windows GDI print sub-system. The contents of this file are printer specific.

If no media is present, the device waits for the period of time specified by the *dwTimeOut* parameter in the **WFSExecute** call for media to be inserted from the external paper source.

This command must not complete until all pages have been presented to the customer.

## **Input Param**

## LPWFSPTRPRINTRAWFILE lpPrintRawFile;

#### *lpszFileName*

Pointer to the null-terminated file name. This is the full path and file name of the file to be printed. This value is terminated with a single null character and cannot contain UNICODE characters.

## dwMediaControl

Specifies the manner in which the media should be handled after each page is printed, as a combination of the flags described under WFS\_CMD\_PTR\_CONTROL\_MEDIA. A zero value of this parameter means to do none of these actions, as when printing multiple pages on a single media item. WFS\_PTR\_CTRLCLEARBUFFER is not applicable to this command, in this case WFS\_ERR\_INVALID\_DATA will be returned.

## dwPaperSource

Specifies the paper source to use when printing. When the value is zero the Service Provider will determine the paper source that will be used. This parameter is ignored if there is already paper in the print position. Possible values are:

Value	Meaning
WFS_PTR_PAPERANY	Any paper source can be used; it is
	determined by the service.
WFS_PTR_PAPERUPPER	Use the only paper source or the upper paper
	source, if there is more than one paper
	supply.
WFS_PTR_PAPERLOWER	Use the lower paper source.
WFS_PTR_PAPEREXTERNAL	Use the external paper source (such as
	envelope tray or single sheet feed).
WFS_PTR_PAPERAUX	Use the auxiliary paper source.
WFS_PTR_PAPERAUX2	Use the second auxiliary paper source.
WFS_PTR_PAPERPARK	Use the parking station.

## Output Param None.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS ERR PTR FILENOTFOUND	The specified file cannot be found.
WFS_ERR_PTR_SHUTTERFAIL	Open or close of the shutter failed due to manipulation or hardware error.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed; operator intervention is required.
WFS_ERR_PTR_PAPERJAMMED	The paper is jammed.
WFS_ERR_PTR_PAPEROUT	The paper supply is empty.
WFS_ERR_PTR_TONEROUT	Toner or ink supply is empty or printing contrast with ribbon is not sufficient.
WFS_ERR_PTR_FILE_IO_ERROR	Directory does not exist or a file I/O error occurred while processing the file.

## CWA 16926-3:2022 (E)

WFS_ERR_PTR_NOMEDIAPRESENT WFS_ERR_PTR_FLUSHFAIL	No media is present in the device. The device was not able to flush data.
WFS_ERR_PTR_RETRACTBINFULL	The retract bin is full. No more media can be retracted. The current media is still in the device.
WFS_ERR_PTR_STACKERFULL	The internal stacker is full. No more media can be moved to the stacker.
WFS ERR PTR PAGETURNFAIL	The device was not able to turn the page.
WFS_ERR_PTR_MEDIATURNFAIL	The device was not able to turn the inserted media.
WFS_ERR_PTR_INKOUT	No stamping possible, stamping ink supply empty.
WFS_ERR_PTR_SEQUENCEINVALID	Programming error. Invalid command sequence (e.g. WFS_PTR_CTRLPARK and the parking station is busy).
WFS_ERR_PTR_MEDIAOVERFLOW	The print request has overflowed the print media (e.g. print on a single sheet printer exceeded one page).
WFS_ERR_PTR_MEDIARETAINED	Media has been retracted in attempts to eject it. The device is clear and can be used.
WFS_ERR_PTR_BLACKMARK	Black mark detection has failed, nothing has been printed.
WFS_ERR_PTR_SOURCEINVALID	The selected paper source is not supported by the hardware.
WFS_ERR_PTR_MEDIAREJECTED	The media was rejected during the insertion phase and no data has been printed. The WFS_EXEE_PTR_MEDIAREJECTED execute event is posted with the details. The device is still operational.
WFS_ERR_PTR_MEDIARETRACTED	Presented media was automatically retracted before all wads could be presented and before the command could complete successfully.

**Events** 

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS EXEE PTR NOMEDIA	No media is present in the device.
WFS EXEE PTR MEDIAINSERTED	Media has been inserted into the device.
WFS_EXEE_PTR_MEDIAPRESENTED	Media has been presented for removal. See
	section 11 for further details.
WFS_SRVE_PTR_MEDIATAKEN	The media has been taken by the user.
WFS_USRE_PTR_PAPERTHRESHOLD	The paper supply is low or empty; operator
	intervention is required. Note that this event
	is sent only once, at the point at which the
	supply becomes low or empty. It is sent with
	WFS_PTR_PAPERLOW or
	WFS_PTR_PAPEROUT status.
WFS_USRE_PTR_TONERTHRESHOLD	The toner or ink supply is low or empty or
	the printing contrast with ribbon is weak or
	not sufficient; operator intervention is
	required. Note that this event is sent only
	once, at the point at which the supply
	becomes low or empty. It is sent with
	WFS_PTR_TONERLOW or
	WFS_PTR_TONEROUT status.

WFS USRE PTR RETRACTBINTHRESHOLD

The retract bin is high or full; operator intervention is required. Note that this event is sent only once, at the point at which the bin becomes high or full. It is sent with WFS\_PTR\_RETRACTBINHIGH or WFS\_PTR\_RETRACTBINFULL status. The stamping ink supply is low or empty;

WFS USRE PTR INKTHRESHOLD

The stamping ink supply is low or empty; operator intervention is required. Note that this event is sent only once, at the point at which the supply becomes low or empty. It is sent with WFS\_PTR\_INKLOW or

WFS PTR INKOUT status.

WFS\_EXEE\_PTR\_MEDIAREJECTED

The media has been rejected and presented back to the user. It is available at the entry/exit slot. When the media is removed, a WFS\_SRVE\_PTR\_MEDIATAKEN event

will be sent.

WFS\_SRVE\_PTR\_MEDIAAUTORETRACTED

The presented media has been automatically

retracted.

**Comments** Printing of multiple pages is handled as described in section 11.

## 8.13 WFS\_CMD\_PTR\_LOAD\_DEFINITION

## **Description**

This command is used to load a form (including sub-forms and frames) or media definition into the list of available forms. Once a form or media definition has been loaded through this command it can be used by any of the other form/media definition processing commands. Forms and media definitions loaded through this command are persistently available across re-boots. When a form or media definition is loaded a WFS\_SRVE\_PTR\_DEFINITIONLOADED event is generated to inform applications that a form or media definition has been added or replaced.

### **Input Param**

## LPWFSPTRLOADDEFINITION lpLoadDefinition;

#### *lpszFileName*

Pointer to the null-terminated file name. This is the full path and file name of the file to be loaded. This value is terminated with a single null character and cannot contain UNICODE characters. The file contains the form (including sub-forms and frames) or media definition in text format as described in the section 10 (ASCII or UNICODE). Only one form or media definition can be defined in the file.

#### bOverwrite

Specifies if an existing form or media definition with the same name is to be replaced. If this flag is TRUE then an existing form or media definition with the same name will be replaced, unless the command fails with an error, where the definition will remain unchanged. If this flag is FALSE this command will fail with an error if the form or media definition already exists.

## Output Param None.

## Error Codes

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_FILENOTFOUND	The specified file cannot be found.
WFS_ERR_PTR_FORMINVALID	The form is invalid.
WFS_ERR_PTR_MEDIAINVALID	The media definition is invalid.
WFS_ERR_PTR_DEFINITIONEXISTS	The specified form or media definition
	already exists and the bOverwrite flag was
	FALSE.

## Events

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_SRVE_PTR_DEFINITIONLOADED	A form or media definition has been loaded; an existing definition may have been modified by replacement.

## **Comments**

None.

# 8.14 WFS\_CMD\_PTR\_SUPPLY\_REPLENISH

## **Description**

After the supplies have been replenished, this command is used to indicate that one or more supplies have been replenished and are expected to be in a healthy state.

Hardware that cannot detect the level of a supply and reports on the supply's status using metrics (or some other means), must assume the supply has been fully replenished after this command is issued. The appropriate threshold event must be broadcast.

Hardware that can detect the level of a supply must update its status based on its sensors, generate a threshold event if appropriate, and succeed the command even if the supply has not been replenished. If it has already detected the level and reported the threshold before this command was issued, the command must succeed and no threshold event is required.

## **Input Param**

## LPWFSPTRSUPPLYREPLEN lpSupplyReplen;

## fwSupplyReplen

Specifies the supply that was replenished as a combination of the following flags:

Value	Meaning
WFS_PTR_REPLEN_PAPERUPPER	The only paper supply or the upper paper
	supply was replenished.
WFS_PTR_REPLEN_PAPERLOWER	The lower paper supply was replenished.
WFS_PTR_REPLEN_PAPERAUX	The auxiliary paper supply was replenished.
WFS_PTR_REPLEN_PAPERAUX2	The second auxiliary paper supply was
	replenished.
WFS_PTR_REPLEN_TONER	The toner supply was replenished.
WFS PTR REPLEN INK	The ink supply was replenished.
WFS PTR REPLEN LAMP	The imaging lamp was replaced.

## Output Param None.

## **Error Codes**

Only the generic error codes defined in [Ref. 1] can be generated by this command.

### **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WFS_USRE_PTR_PAPERTHRESHOLD	This user event is used to specify that the state of the paper supply threshold has been cleared.
WFS_USRE_PTR_TONERTHRESHOLD	This user event is used to specify that the state of the toner (or ink) supply threshold has been cleared.
WFS_USRE_PTR_INKTHRESHOLD	This user event is used to specify that the state of the stamping ink supply threshold has been cleared.
WFS_USRE_PTR_LAMPTHRESHOLD	This user event is used to specify that the state of the imaging lamp threshold has been cleared.

## **Comments**

If any one of the specified supplies is not supported by a Service Provider,

WFS\_ERR\_UNSUPP\_DATA should be returned, and no replenishment actions will be taken by the Service Provider.

## 8.15 WFS\_CMD\_PTR\_POWER\_SAVE\_CONTROL

**Description** This command activates or deactivates the power-saving mode.

If the Service Provider receives another execute command while in power saving mode, the Service Provider automatically exits the power saving mode, and executes the requested command. If the Service Provider receives an information command while in power saving mode, the Service Provider will not exit the power saving mode.

## **Input Param**

## LPWFSPTRPOWERSAVECONTROL lpPowerSaveControl;

usMaxPowerSaveRecoveryTime

Specifies the maximum number of seconds in which the device must be able to return to its normal operating state when exiting power save mode. The device will be set to the highest possible power save mode within this constraint. If <code>usMaxPowerSaveRecoveryTime</code> is set to zero then the device will exit the power saving mode.

## **Output Param**

None.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_POWERSAVETOOSHORT	The power saving mode has not been activated because the device is not able to resume from the power saving mode within the specified
	usMaxPowerSaveRecoveryTime value.
WFS ERR PTR POWERSAVEMEDIAPRES	ENT
	The power saving mode has not been
	activated because media is present inside the
	activated because media is present inside the device.

## **Events**

In addition to the generic events defined in [Ref. 1], the following events can be generated by this command:

Value	Meaning
WES SRVE PTR POWER SAVE CHANGE	The power save recovery time has changed.

## **Comments**

None.

# 8.16 WFS\_CMD\_PTR\_CONTROL\_PASSBOOK

## **Description**

This command can turn the pages of a passbook inserted in the printer by a specified number of pages in a specified direction and it can close the passbook. The fwControlPassbook field returned by WFS INF PTR CAPABILITIES specifies which functionality is supported. This command flushes the data before the pages are turned or the passbook is closed.

## **Input Param**

## LPWFSPTRCONTROLPASSBOOK lpControlPassbook;

```
typedef struct _wfs_ptr control passbook
     WORD
                          wAction;
     USHORT
                          usCount;
     } WFSPTRCONTROLPASSBOOK, *LPWFSPTRCONTROLPASSBOOK;
```

#### wAction

Specifies the direction of the page turn as one of the following values:

Value	Meaning
WFS PTR PBKCTRLTURNFORWARD	Turns forward the pages of the passbook.
WFS_PTR_PBKCTRLTURNBACKWARD	Turns backward the pages of the passbook.
WFS_PTR_PBKCTRLCLOSEFORWARD	Close the passbook forward.
WFS_PTR_PBKCTRLCLOSEBACKWARD	Close the passbook backward.

#### usCount

Specifies the number of pages to be turned. In the case where wAction is WFS PTR PBKCTRLCLOSEFORWARD or WFS PTR PBKCTRLCLOSEBACKWARD, this field will be ignored.

## Output Param None.

## **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_NOMEDIAPRESENT	No media present in a position where it should be or the media was removed during
WFS ERR PTR PAGETURNFAIL	the operation.  The device was not able to turn the page.
WFS_ERR_PTR_MEDIAJAMMED	The media is jammed. Operator intervention is required.
WFS ERR PTR PASSBOOKCLOSED	There were fewer pages left than specified to
	turn. As a result of the operation, the
	passbook has been closed.
WFS ERR PTR LASTORFIRSTPAGEREACHED	
	The printer cannot close the passbook
because there were fewer pages left than	
specified to turn. As a result of the operation,	
	the last or the first page has been reached
	and is open.
WEG EDD DED MEDIAGIZE	±
WFS_ERR_PTR_MEDIASIZE	The media has an incorrect size.
Only the generic events defined in [Ref. 1] can be generated by this command.	

**Comments** None.

**Events** 

# 8.17 WFS\_CMD\_PTR\_SET\_BLACK\_MARK\_MODE

**Description** This command switches the black mark detection mode and associated functionality on or off.

The black mark detection mode is persistent. If the selected mode is already active this command will complete with WFS SUCCESS. The *bBlackMarkModeSupported* field returned by

WFS INF PTR CAPABILITIES specifies if this functionality is supported.

Input Param LPWFSPTRSETBLACKMARKMODE lpSetBlackMarkMode;

wBlackMarkMode

Specifies the desired black mark detection mode:

Value	Meaning
WFS_PTR_BLACKMARKDETECTIONON	Turns the black mark detection and
	associated functionality on.
WFS PTR BLACKMARKDETECTIONOFF	Turns the black mark detection and
	associated functionality off.

Output Param None.

**Error Codes** Only the generic error codes defined in [Ref. 1] can be generated by this command.

**Events** Only the generic events defined in [Ref. 1] can be generated by this command.

**Comments** None.

### 8.18 WFS CMD PTR SYNCHRONIZE COMMAND

#### **Description**

This command is used to reduce response time of a command (e.g. for synchronization with display) as well as to synchronize actions of the different device classes. This command is intended to be used only on hardware which is capable of synchronizing functionality within a single device class or with other device classes.

The list of execute commands which this command supports for synchronization is retrieved in the *lpdwSynchronizableCommands* parameter of the WFS INF PTR CAPABILITIES.

This command is optional, i.e., any other command can be called without having to call it in advance. Any preparation that occurs by calling this command will not affect any other subsequent command. However, any subsequent execute command other than the one that was specified in the *dwCommand* input parameter will execute normally and may invalidate the pending synchronization. In this case the application should call the

WFS CMD PTR SYNCHRONIZE COMMAND again in order to start a synchronization.

#### **Input Param**

#### LPWFSPTRSYNCHRONIZECOMMAND lpSynchronizeCommand;

#### dwCommand

The command ID of the command to be synchronized and executed next.

#### lpCmdData

Pointer to data or a data structure that represents the parameter that is normally associated with the command that is specified in *dwCommand*. For example, if *dwCommand* is WFS\_CMD\_PTR\_RETRACT\_MEDIA then *lpCmdData* will point to a LPUSHORT. This parameter can be NULL if no command input parameter is needed or if this detail is not needed to synchronize for the command.

It will be device-dependent whether the synchronization is effective or not in the case where the application synchronizes for a command with this command specifying a parameter but subsequently executes the synchronized command with a different parameter. This case should not result in an error; however, the preparation effect could be different from what the application expects. The application should, therefore, make sure to use the same parameter between *lpCmdData* of this command and the subsequent corresponding execute command.

### **Output Param**

None.

#### **Error Codes**

In addition to the generic error codes defined in [Ref. 1], the following error codes can be generated by this command:

Value	Meaning
WFS_ERR_PTR_COMMANDUNSUPP	The command specified in the dwCommand
	field is not supported by the Service
	Provider.
WFS_ERR_PTR_SYNCHRONIZEUNSUPP	The preparation for the command specified
	in the dwCommand with the parameter
	specified in the <i>lpCmdData</i> is not supported
	by the Service Provider.

#### **Events**

Only the generic events defined in [Ref. 1] can be generated by this command.

#### **Comments**

For sample flows of this synchronization see the [Ref 1] Appendix C.

## 9. Events

## 9.1 WFS\_EXEE\_PTR\_NOMEDIA

**Description** This event specifies that the physical media must be inserted into the device in order for the

execute command to proceed.

**Event Param** LPSTR lpszUserPrompt;

lpszUserPrompt

Pointer to a null-terminated user prompt string from the form definition. NULL will be returned if either a form does not define a value for the user prompt or the event is being generated as the

result of a command that does not use forms.

**Comments** The application may use the *lpszUserPrompt* in any manner it sees fit, for example it might

display the string to the operator, along with a message that the media should be inserted.

## 9.2 WFS\_EXEE\_PTR\_MEDIAINSERTED

Description This event specifies that the physical media has been inserted into the device.

**Event Param** None.

The application may use this event to, for example, remove a message box from the screen telling the user to insert a form. **Comments** 

## 9.3 WFS\_EXEE\_PTR\_FIELDERROR

**Description** This event specifies that a fatal error has occurred while processing a field.

**Event Param** LPWFSPTRFIELDFAIL lpFieldFail;

*lpszFormName* 

Points to the null-terminated form name.

lpszFieldName

Points to the null-terminated field name.

wFailure

Specifies the type of failure and can be one of the following values:

Value	Meaning
WFS_PTR_FIELDREQUIRED	The specified field must be supplied by the application.
WFS_PTR_FIELDSTATICOVWR	The specified field is static and thus cannot be overwritten by the application.
WFS_PTR_FIELDOVERFLOW	The value supplied for the specified fields is too long.
WFS PTR FIELDNOTFOUND	The specified field does not exist.
WFS PTR FIELDNOTREAD	The specified field is not an input field.
WFS_PTR_FIELDNOTWRITE	An attempt was made to write to an input
	field.
WFS_PTR_FIELDHWERROR	The specified field uses special hardware
	(e.g. OCR, Low/High coercivity, etc.) and an error occurred.
WFS_PTR_FIELDTYPENOTSUPPORTED	The form field type is not supported with device.
WFS_PTR_FIELDGRAPHIC	The specified graphic image could not be printed.
WFS_PTR_CHARSETFORM	Service Provider does not support character set specified in form.

# 9.4 WFS\_EXEE\_PTR\_FIELDWARNING

**Description** This event is used to specify that a non-fatal error has occurred while processing a field.

**Event Param** LPWFSPTRFIELDFAIL lpFieldFail;

As defined in the section describing WFS\_EXEE\_PTR\_FIELDERROR.

## 9.5 WFS\_USRE\_PTR\_RETRACTBINTHRESHOLD

**Description** This event specifies that the status of the retract bin holding the retracted media has changed.

**Event Param** LPWFSPTRBINTHRESHOLD lpBinThreshold;

usBinNumber

Number of the retract bin for which the status has changed.

wRetractBin

Specifies the current state of the retract bin as one of the following values:

Value	Meaning
WFS_PTR_RETRACTBINOK	The retract bin of the printer is in a good
	state.
WFS_PTR_RETRACTBINFULL	The retract bin of the printer is full.
WFS_PTR_RETRACTBINHIGH	The retract bin of the printer is high.

## 9.6 WFS\_SRVE\_PTR\_MEDIATAKEN

**Description** This event is sent when the media is taken from the exit slot following the completion of a

successful eject operation or following a WFS\_EXEE\_PTR\_MEDIAREJECTED event. For devices that do not physically move media, this event may also be generated when the media is

taken from the device.

Event Param None.

**Comments** Note that since this event can occur after the completion of a function that includes a media eject,

it is not an execute event.

## 9.7 WFS\_USRE\_PTR\_PAPERTHRESHOLD

**Description** 

This user event is used to specify that the state of the paper reached a threshold. There is no threshold defined for the parking station as this can contain only one paper item.

**Event Param** 

LPWFSPTRPAPERTHRESHOLD lpPaperThreshold;

wPaperSource

Specifies the paper sources as one of the following values:

Value	Meaning
WFS_PTR_PAPERUPPER	The only paper source or the upper paper
	source, if there is more than one paper
	supply.
WFS_PTR_PAPERLOWER	The lower paper source.
WFS_PTR_PAPEREXTERNAL	The external paper source (such as envelope
	tray or single sheet feed).
WFS_PTR_PAPERAUX	The auxiliary paper source.
WFS_PTR_PAPERAUX2	The second auxiliary paper source.

wPaperThreshold

Specifies the current state of the paper source as one of the following values:

Value	Meaning
WFS_PTR_PAPERFULL	The paper in the paper source is in a good
	state.
WFS_PTR_PAPERLOW	The paper in the paper source is low.
WFS_PTR_PAPEROUT	The paper in the paper source is out.

Comments

None.

## 9.8 WFS\_USRE\_PTR\_TONERTHRESHOLD

**Description** This user event is used to specify that the state of the toner (or ink) reached a threshold.

**Event Param** LPWORD lpwTonerThreshold;

lpwTonerThreshold

Pointer to the current state of the toner (or ink) as one of the following values:

Value	Meaning
WFS_PTR_TONERFULL	The toner (or ink) in the printer is in a good
	state.
WFS_PTR_TONERLOW	The toner (or ink) in the printer is low.
WFS_PTR_TONEROUT	The toner (or ink) in the printer is out.

## 9.9 WFS\_SRVE\_PTR\_MEDIAINSERTED

**Description** This event specifies that the physical media has been inserted into the device without any read or

print execute commands being executed. This event is only generated when media is entered in an

unsolicited manner.

Event Param None.

## 9.10 WFS\_USRE\_PTR\_LAMPTHRESHOLD

**Description** This user event is used to specify that the state of the imaging lamp reached a threshold.

**Event Param** LPWORD lpwLampThreshold;

lpwLampThreshold

Pointer to the current state of the imaging lamp as one of the following values:

Value	Meaning
WFS_PTR_LAMPOK	The imaging lamp is in a good state.
WFS_PTR_LAMPFADING	The imaging lamp is fading and should be
	changed.
WFS_PTR_LAMPINOP	The imaging lamp is inoperative.

## 9.11 WFS\_USRE\_PTR\_INKTHRESHOLD

**Description** This user event is used to specify that the state of the stamping ink reached a threshold.

**Event Param** LPWORD lpwInkThreshold;

lpwInkThreshold

Pointer to the current state of the stamping ink as one of the following values:

Value	Meaning
WFS_PTR_INKFULL	The stamping ink in the printer is in a good
	state.
WFS_PTR_INKLOW	The stamping ink in the printer is low.
WFS_PTR_INKOUT	The stamping ink in the printer is out.

## 9.12 WFS\_SRVE\_PTR\_MEDIADETECTED

**Description** This event is generated when a media is detected in the device during a reset operation.

### **Event Param** LPWFSPTRMEDIADETECTED lpMediaDetected;

### wPosition

Specifies the media position after the reset operation, as one of the following values:

Value	Meaning
WFS_PTR_MEDIARETRACTED	The media was retracted during the reset operation.
WFS_PTR_MEDIAPRESENT	The media is in the print position or on the stacker.
WFS_PTR_MEDIAENTERING	The media is in the exit slot.
WFS_PTR_MEDIAJAMMED	The media is jammed in the device.
WFS_PTR_MEDIAUNKNOWN	The media is in an unknown position.
WFS_PTR_MEDIAEXPELLED	The media was expelled during the reset operation.

### usRetractBinNumber

Number of the retract bin the media was retracted to. This number has to be between one and the number of bins supported by this device. It is only relevant if *wPosition* equals WFS PTR MEDIARETRACTED.

## 9.13 WFS\_SRVE\_PTR\_RETRACTBINSTATUS

**Description** This event specifies that the status of the retract bin has changed.

**Event Param** LPWFSPTRBINSTATUS lpBinStatus;

usBinNumber

Number of the retract bin for which the status has changed.

wRetractBin

Specifies the current state of the retract bin as one of the following values:

Value	Meaning
WFS_PTR_RETRACTBININSERTED	The retract bin has been inserted.
WFS_PTR_RETRACTBINREMOVED	The retract bin has been removed.

## 9.14 WFS\_EXEE\_PTR\_MEDIAPRESENTED

**Description** This event is used to indicate when media has been presented to the customer for removal.

### **Event Param** LPWFSPTRMEDIAPRESENTED lpMediaPresented;

usWadIndex

Specifies the index (starting from one) of the presented wad, where a wad is a bunch of one or more pages presented as a bunch.

usTotalWads

Specifies the total number of wads in the print job, zero if the total number of wads is not known.

## 9.15 WFS\_SRVE\_PTR\_DEFINITIONLOADED

**Description** This event is used to indicate when a form or media definition has successfully been loaded via

the WFS\_CMD\_PTR\_LOAD\_DEFINITION command.

**Event Param** LPWFSPTRDEFINITIONLOADED lpDefinitionLoaded;

lpszDefinitionName

Specifies the name of the form or media just loaded.

*dwDefinitionType* 

Specifies the type of definition loaded. This field can be one of the following values:

Value	Meaning
WFS_PTR_FORMLOADED	The form identified by lpszDefinitionName
	has been loaded.
WFS_PTR_MEDIALOADED	The media identified by lpszDefinitionName
	has been loaded.

## 9.16 WFS\_EXEE\_PTR\_MEDIAREJECTED

### **Description**

This event is generated as a result of physical media that is rejected whenever an attempt is made to insert media into the physical device. Rejection of the media will cause the command currently executing to complete with a WFS\_ERR\_PTR\_MEDIAREJECTED error, at which point the media should be removed.

#### **Event Param**

### LPWFSPTRMEDIAREJECTED lpMediaRejected;

#### wMediaRejected

Specifies the reason for rejecting the media as one of the following values:

Value	Meaning
WFS_PTR_REJECT_SHORT	The rejected media was too short.
WFS_PTR_REJECT_LONG	The rejected media was too long.
WFS_PTR_REJECT_MULTIPLE	The media was rejected due to insertion of multiple documents.
WFS_PTR_REJECT_ALIGN	The media could not be aligned and was rejected.
WFS_PTR_REJECT_MOVETOALIGN	The media could not be transported to the align area and was rejected.
WFS_PTR_REJECT_SHUTTER	The media was rejected due to the shutter failing to close.
WFS_PTR_REJECT_ESCROW	The media was rejected due to problems transporting media to the escrow position.
WFS PTR REJECT THICK	The rejected media was too thick.
WFS_PTR_REJECT_OTHER	The media was rejected due to a reason other than those listed above.

### Comments

The application may use this event to (for example) display a message box on the screen indicating why the media was rejected, and telling the user to remove and reinsert the media.

## 9.17 WFS\_SRVE\_PTR\_MEDIAPRESENTED

**Description** This event is used to indicate when media has been presented to the customer for removal as a

result of a print operation through some non-XFS interface.

**Event Param** LPWFSPTRMEDIAPRESENTED lpMediaPresented;

usWadIndex

Specifies the index (starting from one) of the presented wad, where a wad is a bunch of one or more pages presented as a bunch.

usTotalWads

Specifies the total number of wads in the print job, zero if the total number of wads is not known.

## 9.18 WFS\_SRVE\_PTR\_MEDIAAUTORETRACTED

### **Description**

This event indicates when media has been automatically retracted by the device. Support for this event is indicated when the *usAutoRetractPeriod* field of the WFS\_INF\_PTR\_CAPABILITIES output structure is non-zero. The event can be generated as the result of any command that presents media to the customer.

#### **Event Param**

### LPWFSPTRMEDIARETRACTED lpMediaRetracted

#### wRetractResult

Specifies the result of the automatic retraction, as one of the following values:

Value	Meaning
WFS PTR AUTO RETRACT OK	The media was retracted successfully.
WFS_PTR_AUTO_RETRACT_MEDIAJAMI	MED
	The media is jammed.

usBinNumber

Number of the retract bin the media was retracted to or zero if the media is retracted to the transport. This number has to be between zero and the number of bins supported by this device. This value is also zero if *wRetractResult* is WFS\_PTR\_AUTO\_RETRACT\_MEDIAJAMMED.

#### **Comments**

None.

## 9.19 WFS\_SRVE\_PTR\_DEVICEPOSITION

**Description** This service event reports that the device has changed its position status.

**Event Param** LPWFSPTRDEVICEPOSITION lpDevicePosition;

wPosition

Position of the device as one of the following values:

Value	Meaning	
WFS_PTR_DEVICEINPOSITION	The device is in its normal operating	
	position.	
WFS_PTR_DEVICENOTINPOSITION	The device has been removed from its	
	normal operating position.	
WFS_PTR_DEVICEPOSUNKNOWN	The position of the device cannot be	
	determined.	

## 9.20 WFS\_SRVE\_PTR\_POWER\_SAVE\_CHANGE

**Description** This service event specifies that the power save recovery time has changed.

**Event Param** LPWFSPTRPOWERSAVECHANGE lpPowerSaveChange;

usPowerSaveRecoveryTime

Specifies the actual number of seconds required by the device to resume its normal operational state. This value is zero if the device exited the power saving mode.

**Comments** 

If another device class compounded with this device enters into a power saving mode this device will automatically enter into the same power saving mode and this event will be generated.

## 10. Form, Sub-Form, Field, Frame, Table and Media Definitions

This section outlines the format of the definitions of forms, the fields within them, optional tables and fields within the form, and the media on which they are printed.

## 10.1 Definition Syntax

The syntactic rules for form, field and media definitions are as follows:

White space space, tabLine continuation backslash (\)

• Line termination CR, LF, CR/LF; line termination ends a "keyword section"

(a keyword and its value[s])

• Keywords must be all upper case

Names (field/media/font names) any case; case is preserved;

Service Providers are case sensitive

• Strings all strings must be enclosed in double quote characters (");

standard C escape sequences are allowed.

• Comments start with two forward slashes (//), end at line termination

#### Other notes:

• The values of a keyword are separated by commas.

- If a keyword is present, all its values must be specified; default values are used only if the keyword is
  absent.
- Values that are character strings are marked with asterisks in the definitions below, and must be quoted as specified above.
- The order of attributes within the forms is not mandatory and the attributes may be defined in any order.
- All forms can be represented using either ISO 646 (ANSI) or UNICODE character encoding. If the
  UNICODE representation is used then all Names and Strings are restricted to an internal representation
  of ISO 646 (ANSI) characters. Only the INITIALVALUE and FORMAT keyword values can have
  double byte values outside of the ISO 646 (ANSI) character set.
- If forms character encoding is UNICODE then, consistent with the UNICODE standard, the file prefix must be in Little Endian (0xFFFE) or Big Endian (0xFEFF) notation, such that UNICODE encoding is recognized.
- A form and its optional subforms that have multiple XFSFIELDs with the same *fieldname* are invalid. The WFS ERR PTR FORMINVALID error will be returned if specified in the input to the command.
- A form that has multiple XFSSUBFORMs with the same subformname is invalid. The WFS ERR PTR FORMINVALID error will be returned if specified in the input to the command.
- A form and its optional subforms that have multiple XFSFRAMEs with the same *framename* are invalid. The WFS ERR PTR FORMINVALID error will be returned if specified in the input to the command.

### 10.2 Form and Media Measurements

The UNIT keyword sections of the form and media definitions specify the base horizontal and vertical resolution as follows:

- The base value specifies the base unit of measurement.
- The x and y values specify the horizontal and vertical resolution as fractions of the base value (e.g. an x value of 10 and a base value of MM means that the base horizontal resolution is 0.1mm).

The base resolutions thus defined by the UNIT keyword section of the XFSFORM definition are used as the units of the form definition keyword sections:

- SIZE (width and height values)
- ALIGNMENT (xoffset and yoffset values)

and of the sub-form definition keyword sections:

- POSITION (x and y values)
- SIZE (width and height values)

and of the field definition keyword sections:

- POSITION (x and y values)
- SIZE (width and height values)
- INDEX (xoffset and yoffset values)

and of the frame definition keyword sections:

- POSITION (x and y values)
- SIZE (width and height values)
- REPEATONX (xoffset value)
- REPEATONY (yoffset value)

The base resolutions thus defined by the UNIT keyword section of the XFSMEDIA definition are used as the units of the media definition keyword sections:

- SIZE (width and height values)
- PRINTAREA (x, y, width and height values)
- RESTRICTED (x, y, width and height values)

NOTE: The origin for coordinate based systems is (0,0). The origin for row/column based systems can be (0,0) or (1,1) and must be configurable within the Service Provider.

# 10.3 Form Definition <sup>1</sup>

XFSFORM		formname*		
BEGIN				
(required)	UNIT	base,	Base resolution unit for form definition:  MM INCH	
			ROWCOLUMN	
		<i>x</i> ,	Horizontal base unit fraction Vertical base unit fraction	
(required)	SIZE	y width,	Width of form	
(required)	SIZE	height	Height of form	
	ALIGNMENT	alignment,	Alignment of the form on the physical media:  TOPLEFT (default)  TOPRIGHT	
			BOTTOMLEFT BOTTOMRIGHT	
			This option allows the positioning of a form onto a physical page relative to any combination of the edges of the physical media, to support the variations in how devices sense the edge of page for positioning purposes.	
		xoffset,	Horizontal offset relative to the horizontal alignment specified by alignment. Always specified as a positive value (i.e. if aligned to the right side of the media, means offset the form to the left). (default = 0)	
		yoffset	Vertical offset relative to the vertical alignment specified by alignment. Always specified as a positive value (i.e. if aligned to the bottom of the media, means offset the form upward). (default = 0)	
	ORIENTATION	type	Orientation of form: PORTRAIT (default) LANDSCAPE	
	SKEW	skewfactor	Maximum skew factor in degrees (default = 0)	
	VERSION	major,	Major version number	
		minor, date*, author*	Minor version number Creation/modification date Author of form	
(required)	LANGUAGE	languageID	Language used in this form - a 16 bit value (LANGID) which is a combination of a primary (10 bits) and a secondary (6 bits) language ID (This is the standard language ID in the Win32 API; standard macros support construction and decomposition of this composite ID)	
	СРІ	cpi	Characters per inch. This value specifies the default CPI within the form. When the ROWCOLUMN unit is used, the form CPI and LPI are used to calculate the position and size of all fields within a form, irrespective of the CPI and LPI of the fields themselves.	
	LPI	lpi	Lines per inch. This value specifies the default LPI within the form. When the ROWCOLUMN unit is used, the form CPI and LPI are used to calculate the position and size of all fields within a form, irrespective of the CPI and LPI of the fields themselves.	
	POINTSIZE	pointsize	This value specifies the default POINTSIZE within the form.	
	COPYRIGHT	copyright*	Copyright entry	
	TITLE	title*	Title of form	
	COMMENT	comment*	Comment section	
	USERPROMPT	prompt*	Prompt string for user interaction	

\_

 $<sup>^{\</sup>rm 1}$  Attributes are not required in any mandatory order within a Form definition.

[ XFSFIELD  BEGI END		One field definition (as defined in the next section) for each field in the form. The <i>fieldname</i> within a form and its optional subforms must be unique.
[ XFSFRAME  BEG		One frame definition (as defined in the next section) for each frame in the form. The <i>framename</i> within a form and its optional subforms must be unique.
[ XFSSUBFOR  BEGI END	IN	One subform definition (as defined in the next section) for each subform in the form. The <i>subformname</i> within a form must be unique.
END		

## 10.4 SubForm Definition <sup>2</sup>

XFSSUBFORM		subformname*	The subformname within a form must be unique.	
BEGIN			•	
(required)	POSITION	X, Y or (Y, Z)	Horizontal position (relative to left side of form) Vertical position (relative to top of form). Format (Y, Z) is used to indicate vertical positioning relative to top of form when top of form is other than 1 <sup>st</sup> page of form, where Z indicates page number (relative to 0) and Y indicates base resolution units relative to top of the form page number (as indicated by Z). Format Y is used to indicate vertical positioning relative to top of the 1 <sup>st</sup> form page.	
(required)	SIZE	width, height	Width of subform. Width must not exceed width of form. Height of subform. Height must not exceed height of form.	
	END	fieldname*	One field definition (as defined in the next section) for each field in the subform. The fieldname within a form and its optional subforms must be unique.	
	BEGIN END	framename*	One frame definition (as defined in the next section) for each frame in the subform. The framename within a form and its optional subforms must be unique.	
END				

The XFSSUBFORM definition provides a means to isolate a selected area of a form where the user may want to have a select group of fields, frames, and/or running headers and footers. All field and frame definitions within a subform are relative to the POSITION of the subform. A form definition with an imbedded subform will have a series of statements illustrated as follows:

```
XFSFORM
BEGIN

*

XFSSUBFORM
BEGIN

XFSFIELD
BEGIN

*

END
XFSFIELD
BEGIN

*

END
END
END
```

-

<sup>&</sup>lt;sup>2</sup> Attributes are not required in any mandatory order within a SubForm definition.

# 10.5 Field Definition <sup>3</sup>

XFSFIELD		fieldname*	The <i>fieldname</i> within a form and its optional subforms must be unique.
BEGIN			oc unique.
(required)	POSITION	X, Y or (Y, Z)	Horizontal position (relative to left side of form/subform). Vertical position (relative to top of form/subform). Format (Y, Z) is used to indicate vertical positioning relative to top of form/subform when top of form/subform is other than 1 <sup>st</sup> page of form/subform, where Z indicates page number (relative to 0) and Y indicates base resolution units relative to top of the form/subform page number (as indicated by Z). Format Y is used to indicate vertical positioning relative to top of the 1 <sup>st</sup> form/subform.
	FOLLOWS	fieldname*	Print this field directly following the field with the name <fieldname>; positioning information is ignored. See the description of WFS_CMD_PTR_PRINT_FORM.  If FOLLOWS is omitted then fields are printed in the order that they appear in the form definition.</fieldname>
	HEADER	N	This field is either a form/subform header field.  N represents a form/subform page number (relative to 0) the header field is to print within.
		N-N	N-N represents a form/subform page number range the header field is to print within.  Combinations of N and N-N may exist separated by commas.
		ALL	ALL indicates that header field is to be printed on all pages of form/subform.  The form/subform page number is intended to supplement the Z parameter of the POSITION keyword.  For example 0,2-4,6 indicates that the header field is to print on relative form/subform pages 0, 2, 3, 4, and 6.
	FOOTER	N N-N	This field is either a form/subform footer field.  N represents a form/subform page number (relative to 0) the footer field is to print within.  N-N represents a form/subform page number range the footer field is to print within.  Combinations of N and N-N may exist separated by
		All	commas.  ALL indicates that footer field is to be printed on all pages of form/subform.  The form/subform page number is intended to supplement the Z parameter of the POSITION keyword.  For example 0,2-4,6 indicates that the footer field is to print on relative form/subform pages 0, 2, 3, 4, and 6.
	SIDE	side	Side of form where field is positioned: FRONT (default) BACK
(required)	SIZE	width, height	Field width Field height
	INDEX	repeatcount, xoffset, yoffset	Count how often this field is repeated in the form, INDEX fields are fixed length. (default is no INDEX field) Horizontal offset for next field Vertical offset for next field

\_

<sup>&</sup>lt;sup>3</sup> Attributes are not required in any mandatory order within a Field definition.

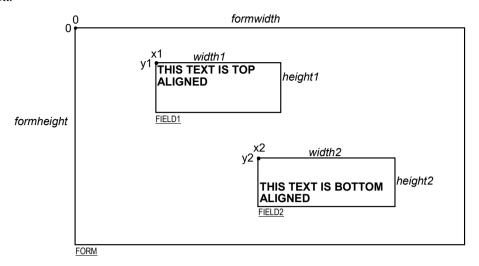

ТҮРЕ	fieldtype	Type of field:	
	Jiciaiype	TEXT (default)	
		MICR	
		OCR	
		MSF	
		BARCODE	
		GRAPHIC	
GGALDIG		PAGEMARK	
SCALING	scalingtype	Information on how to size the GRAPHIC within the field:	
		BESTFIT (default) scale to size indicated	
		ASIS render at native size	
		MAINTAINASPECT	
		scale as close as possible to size	
		indicated while maintaining the	
		aspect ratio and not losing graphic	
		information.	
		SCALING is only relevant for GRAPHIC field types.	
BARCODE	hriposition	Position of the HRI (Human Readable Interpretation)	
		characters:	
		NONE (default)	
		ABOVE	
		BELOW	
		ВОТН	
		The type of barcode to print is defined in the FONT field.	
COERCIVITY	coercivity	Coercivity to be used for writing to the magnetic stripe:	
	-	AUTO (default) decided by the Service	
		Provider or the hardware	
		LOW low coercivity	
		HIGH high coercivity	
		COERCIVITY is only relevant for MSF field types.	
CLASS	class	Field class:	
		OPTIONAL (default)	
		STATIC	
		REQUIRED	
ACCESS	access	Access rights of field:	
		WRITE (default)	
		READ	
		READWRITE	
OVERFLOW	overflow	Action on field overflow:	
	0.2.3.077	TERMINATE (default)	
		TRUNCATE (default)	
		BESTFIT (the Service Provider fits the data	
		into the field as well as it can)	
		OVERWRITE (a contiguous write)	
		WORDWRAP	
		WORDWKAF	

CONTENT D	a4.1-	Display attributes as s
CASE	case	Display attributes as a combination of the following, ORed together using the " " operator:  NORMAL (default)  BOLD  ITALIC  UNDER (single underline)  DOUBLEUNDER (double underline)  DOUBLE (double width)  TRIPLE (triple width)  QUADRUPLE (quadruple width)  STRIKETHROUGH  ROTATE90 (rotate 90 degrees clockwise)  ROTATE270 (rotate 270 degrees clockwise)  UPSIDEDOWN (upside down)  PROPORTIONAL (proportional spacing)  DOUBLEHIGH  TRIPLEHIGH  QUADRUPLEHIGH  CONDENSED  SUPERSCRIPT  SUBSCRIPT  OVERSCORE  LETTERQUALITY  NEARLETTERQUALITY  DOUBLESTRIKE  OPAQUE (If omitted then default attribute is transparent)  Some of these Styles may be mutually exclusive, or may combine to provide unexpected results.  Convert field contents to:  NOCHANGE (default)
HORIZONTAL	justify	UPPER LOWER  Horizontal alignment of field contents:  LEFT (default)  RIGHT
		CENTER JUSTIFY
VERTICAL	justify	Vertical alignment of field contents:  BOTTOM (default)  CENTER  TOP
COLOR	color	Color name: BLACK (default) WHITE GRAY RED BLUE GREEN YELLOW
RGBCOLOR	R, G, B	Color in RGB 8 bits per color format:  R - Red portion of the RGB value 0-255.  G - Green portion of the RGB value 0-255.  B - Blue portion of the RGB value 0-255.  RGBCOLOR overrides the COLOR attribute.
LANGUAGE	languageID	Language used in this field - a 16 bit value (LANGID) which is a combination of a primary (10 bits) and a secondary (6 bits) language ID (This is the standard language ID in the Win32 API; standard macros support construction and decomposition of this composite ID). If unspecified defaults to form definition LANGUAGE specification.

## CWA 16926-3:2022 (E)

	FONT	fontname*	Font name: This attribute is interpreted by the Service Provider. In some cases it may indicate printer resident fonts, and in others it may indicate the name of a downloadable font. For BARCODE fields it represents the barcode font name.  In some cases this predefines the following parameters:
	POINTSIZE	pointsize	Point size. If unspecified, the point size defaults to the POINTSIZE defined for the form.
	CPI	cpi	Characters per inch. If unspecified, the CPI defaults to the CPI defined for the form.
	LPI	lpi	Lines per inch. If unspecified, the LPI defaults to the LPI defined for the form.
	FORMAT	formatstring*	This is an application defined input field describing how the application should format the data. This may be interpreted by the Service Provider.
	INITIALVALUE	value*	Initial value. For GRAPHIC type fields, this value may contain the filename of the graphic image. The type of this graphic will be determined by the file extension (e.g. BMP for Windows Bitmap). Graphic file name may be full or partial path.  For example "C:\BSVC\BSVCLOGO.BMP" illustrates use of full path name.  A file name specification of "LOGO.BMP" illustrates partial path name. In this instance file is obtained from current directory. Graphic contents can be changed dynamically at run-time and the new content will be printed on the next print action.
END			

The following diagrams illustrate the positioning and sizing of text fields on a form, and, in particular, the vertical alignment of text within a field using **VERTICAL=TOP** and **VERTICAL=BOTTOM** values in the field definition.

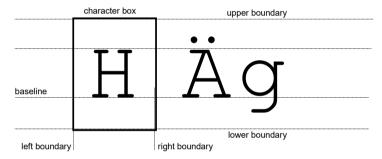

**VERTICAL=TOP** The upper boundary of the character drawing box (shown below)

is positioned vertically to the upper field boundary.

**VERTICAL=BOTTOM** The baseline of the character drawing box (shown below)

is positioned vertically to the lower field boundary.

Definition of the character drawing box:

When more than one line of text is to be printed in a field, and the definition includes VERTICAL=BOTTOM, the vertical position of the first line is calculated using the specified (or implied) LPI value.

# 10.6 Frame Definition <sup>4</sup>

XFSFRAME		framename*	
BEGIN			
(required)	POSITION	X, Y or (Y, Z)	Horizontal position of top left corner of the frame (relative to left side of form/subform).  Vertical position of top left corner of frame (relative to top of form/subform).  Format (Y, Z) is used to indicate vertical positioning of the top left corner of the frame relative to top of form/subform when top of form/subform is other than 1st page of form/subform, where Z indicates page number (relative to 0) and Y indicates base resolution units relative to top of the form/subform page number (as indicated by Z).  Format Y is used to indicate vertical positioning of the left corner of frame relative to top of the 1st form/subform.
	FRAMES	fieldname*	Frames the field with the name <fieldname>, positioning and size information are ignored.  The frame surrounds the complete field, not just the printed data.  If the field is repeated, the frame surrounds the first and last fields that are printed.</fieldname>
	HEADER	N N-N	This frame is either a form/subform header frame.  N represents a form/subform page number (relative to 0) the header frame is to print within.  N-N represents a form/subform page number range the header frame is to print within.  Combinations of N and N-N may exist separated by
		ALL	commas. ALL indicates that header frame is to be printed on all pages of form/subform. The form/subform page number is intended to supplement the Z parameter of the POSITION keyword. For example 0,2-4,6 indicates that the header frame is to print on relative form/subform pages 0, 2, 3, 4, and 6.
	FOOTER	N N-N ALL	This field is either a form/subform footer frame.  N represents a form/subform page number (relative to 0) the footer frame is to print within.  N-N represents a form/subform page number range the footer frame is to print within.  Combinations of N and N-N may exist separated by commas.  ALL indicates that footer frame is to be printed on all pages
	SIDE		of form/subform.  The form/subform page number is intended to supplement the Z parameter of the POSITION keyword.  For example 0,2-4,6 indicates that the footer frame is to print on relative form/subform pages 0, 2, 3, 4, and 6.
	SIDE	side	Side of form where this frame is positioned: FRONT (default) BACK
(required)	SIZE REPEATONX	width, height repeatcount,	Frame width in base horizontal units for the form Frame height in base vertical units for the form Count how often this frame is repeated horizontally in the
		xoffset	form. Horizontal offset for next frame in base horizontal units.
	REPEATONY	repeatcount, yoffset	Count how often this frame is repeated vertically in the form.  Vertical offset for next frame in base vertical units.

\_

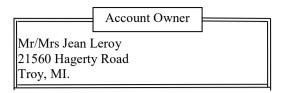

<sup>&</sup>lt;sup>4</sup> Attributes are not required in any mandatory order within a Frame definition.

TYPE	frametype	Type of frame:	
		RECTANGLE (default)	
		ROUNDED_CORNER	
		ELLIPSE	
CLASS	class	Frame class:	
		STATIC (default)	
		OPTIONAL	
		(The frame is printed only if its	
		name appears in the list of field	
		names given as parameter to the	
		WFSExecute command. In this	
		case, the name of the frame	
		must be different from all the	
		names of the fields.)	
OVERFLOW	overflow	Action on frame overflowing the form:	
		TERMINATE (default)	
		TRUNCATE	
		BESTFIT (the Service Provider fits the	
		frame into the media as well	
		as it can)	
STYLE	style	Frame line attributes:	
		SINGLE THIN (default)	
		DOUBLE THIN	
		SINGLE THICK	
		DOUBLE THICK	
		DOTTED	
COLOR	color	Color name for frame lines:	
		BLACK (default)	
		WHITE	
		GRAY	
		RED	
		BLUE	
		GREEN	
		YELLOW	
RGBCOLOR	R, G, B	Color in RGB 8 bits per color format:	
		R - Red portion of the RGB value 0-255.	
		G - Green portion of the RGB value 0-255.	
		B - Blue portion of the RGB value 0-255.	
		RGBCOLOR overrides the COLOR attribute.	
FILLCOLOR	color	Color name for interior of frame:	
		BLACK	
		WHITE (default)	
		GRAY	
		RED	
		BLUE	
		GREEN	
		YELLOW	
RGBFILLCOLOR	R, G, B	Color in RGB 8 bits per color format:	
		R - Red portion of the RGB value 0-255.	
		G - Green portion of the RGB value 0-255.	
		B - Blue portion of the RGB value 0-255.	
		RGBFILLCOLOR overrides the FILLCOLOR attribute.	

## CWA 16926-3:2022 (E)

DILL CONT. E	. 1	C. 1 C C11: .1	
FILLSTYLE	style	Style for filling the interior of frame:	
		NONE	(default)
		SOLID	Solid color
		BDIAGONAL	Downward hatch (left to
			right) at 45 degrees
		CROSS	Horizontal and vertical
			crosshatch
		DIAGCROSS	Crosshatch at 45 degrees
		FDIAGONAL	Upward hatch (left to
			right) at 45 degrees
		HORIZONTAL	Horizontal hatch
		VERTICAL	Vertical hatch
SUBSTSIGN	substitute	Character that is used as substitute sign when a character in	
	sign	a read field cannot be read.	
TITLE	fieldname*	Uses the field with the name <fieldname> as the title of the</fieldname>	
		frame. Positioning information of the field is ignored.	
HORIZONTAL	justify	Horizontal alignment of the frame title:	
		LEFT (default)	
		CENTER	
		RIGHT	
VERTICAL	justify	Vertical alignment of the frame title:	
		TOP (default)	
		BOTTOM	
END			

The XFSFRAME definition provides a means for framing a XFSFIELD text field. The basic concept of a XFSFRAME definition and corresponding XFSFIELD definition is illustrated as follows:

When the **XFSFRAME** frames a field, its positioning and size information are ignored. Instead, Service Providers should position the top left corner of the frame one horizontal base unit to the left and one vertical base unit to the top of the top left corner of the field. Similarly, Service Providers should size the frame so that it bottom right corner is one base unit below and to the right to the field. For instance, if the form units are **ROWCOLUMN**, and a **XFSFRAME** "A" is said to frame the **XFSFIELD** "B" which is positioned at row 1, column 1 with a size of 1 row and 20 columns, the frame will be drawn from row 0, column 0 to row 3, column 22.

The horizontal and vertical positioning of a frame title overrides the position of the named **XFSFIELD**. For instance, if a **XFSFRAME** "A" is said to have the **XFSFIELD** "B" as its title, with the default horizontal and vertical title justification, it is just as if **XFSFIELD** "B" had been positioned at the top left corner of the frame. Note that the **SIZE** information for the title field still is meaningful; it gives the starting and/or ending positions of the frame lines.

The SIDE attributes of the XFSFRAME and the XFSFIELDs it refers to must agree.

The width of the lines and the interval between the lines of doubled frames are vendor specific. Whether the lines are drawn using graphics printing or using pseudo-graphic is vendor specific. However, Service Providers are responsible for rendering intersecting frames.

Depending on the printer technology, framing of fields can substantially slow down the print process.

Support of framing by a Service Provider or the device it controls is not mandatory to be XFS compliant.

## Sample 1: Simple framing

XFSFORM "Multiple Balances"

BEGIN

UNIT INCH, 16, 16

Account[1]=0123456789123002

Account[2]=0123456789123003

Balance[0]=\$17465.12

Balance[1] =\$2458.23

Balance[2]=\$6542.78

Will print:

Account	Balance
012345678912300	\$17465.12
1 012345678912300 2 012345678912300	\$2458.23 \$6542.78
3	

When printed with the following field list:

Account[0]=0123456789123001

Balance[0]=\$17465.12

Will print:

Account	Balance
012345678912300 1	\$17465.12

### CWA 16926-3:2022 (E)

END

END	
END	

#### 10.7 Media Definition <sup>5</sup>

The media definition determines those characteristics that result from the combination of a particular media type together with a particular vendor's printer. The aim is to make it easy to move forms between different vendors' printers which might have different constraints on how they handle a specific media type. It is the Service Provider's responsibility to ensure that the form definition does not specify the printing of any fields that conflict with the media definition. An example of such a conflict might be that the form definition asks for a field to be printed in an area that the media definition defines as an unprintable area.

The media definition is also intended to provide the capability of defining media types that are specific to the financial industry. An example is a passbook as shown below.

XFSMEDIA		medianame*	
BEGIN			
	ТҮРЕ	type	Predefined media types are: GENERIC (default) MULTIPART PASSBOOK
	SOURCE	source	Paper source:  ANY (default)  UPPER  LOWER  EXTERNAL (envelope tray or single sheet feed tray)  AUX  AUX2  PARK
(required)	UNIT	base,	Base resolution unit for media definition:  MM INCH ROWCOLUMN Horizontal base unit fraction Vertical base unit fraction
(required)	SIZE	width, height	Width of physical media Height of physical media (0 = unlimited, i.e. roll paper)
	PRINTAREA	x, y, width, height	Printable area relative to top left corner of physical media (default = physical size of media)
	RESTRICTED	x, y, width, height	Restricted area relative to top left corner of physical media (default = no restricted area)
	FOLD	fold	Type of passbook:  HORIZONTAL (default)  VERTICAL
	STAGGERING	staggering	Staggering of passbook from top (default = 0)

<sup>&</sup>lt;sup>5</sup> Attributes are not required in any mandatory order within a Media definition.

\_

	PAGE	count	Number of pages in passbook (default = 0)
	LINES	count	Number of printable lines (default = 0)
END			

## 10.8 XFS Form/Media Definition Files in Multi-Vendor Environments

Although for most Service Providers directory location and extension of XFS form/media definition files are configurable through the registry, the capabilities of Service Providers and or actual hardware may vary. Therefore the following considerations should be taken into account when applications use XFS form definition files with the purpose of running in a multi-vendor environment:

- Physical print area dimensions of printers are not identical.
- Graphic printout may not be supported, which may limit the use of the FONT, CPI and LPI keywords.
- Some printers may have a resolution of dots/mm rather than dots/inch, which may result in printouts with a specific CPI/LPI font resolution to be slightly off size.
- Some form/media definition keywords may not be supported due to limitations of the hardware or software.

# 11. Command and Event Flows during Single and Multi-Page / Wad Printing

It is possible to print a number of pages or bunches of pages (wads) through the XFS Service Provider. The following sections describe how this is achieved.

## 11.1 Single Page / Single Wad Printing with immediate Media Control

This table illustrates the command and event flows in a successful print command (i.e. WFS\_CMD\_PTR\_PRINT\_RAW\_FILE, WFS\_CMD\_PTR\_PRINT\_FORM and WFS\_CMD\_PTR\_RAW\_DATA) where the following conditions apply:

- A single page or single wad of pages is presented.
- The *bMediaPresented* Capability flag is TRUE (indicates that the WFS EXEE PTR MEDIAPRESENTED event can be generated).
- The dwMediaControl flag in the command data is set to WFS PTR CTRLEJECT.

The WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command is used as an example.

Step	End-User	Application	XFS Service Provider	PTR Hardware
1.	User wants a statement printed.			
2.		Win32 used to print statement to a native printer file.		
3.		WFS_CMD_PTR_PRINT RAW_FILE command issued (with dwMediaControl set to WFS_PTR_CTRLEJECT).		
4.			One wad or page is required.	
5.				Wad or page presented.
6.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
7.		WFS_CMD_PTR_PRINT RAW_FILE completes successfully.		
8.	User takes wad/page.			
9.			WFS_SRVE_PTR_MEDIATAKEN event generated.	

# 11.2 Single Page / Single Wad Printing with separate Media Control

This table illustrates the command and event flows in a successful print command (i.e. WFS\_CMD\_PTR\_PRINT\_RAW\_FILE, WFS\_CMD\_PTR\_PRINT\_FORM and WFS\_CMD\_PTR\_RAW\_DATA) where the following conditions apply:

- A single page or single wad of pages is presented.
- The *bMediaPresented* Capability flag is TRUE (indicates that the WFS EXEE PTR MEDIAPRESENTED event can be generated).
- The dwMediaControl flag in the command data is set to zero.
- The media is presented to the user through a WFS\_CMD\_PTR\_CONTROL\_MEDIA command, with the *lpdwMediaControl* flag set to WFS\_PTR\_CTRLEJECT.

The WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command is used as an example.

Step	End-User	Application	XFS Service Provider	PTR Hardware
1.	User wants a statement printed.			
2.		Win32 used to print statement to a native printer file.		
3.		WFS_CMD_PTR_PRINT RAW_FILE command issued (with dwMediaControl set to zero).		
4.		WFS_CMD_PTR_PRINT RAW_FILE completes successfully.		
5.		WFS_CMD_PTR CONTROL_MEDIA ( with lpdwMediaControl set to WFS_PTR_CTRLEJECT).		
6.			One wad or page is required.	
7.				Wad or page presented.
8.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
9.		WFS_CMD_PTR CONTROL_MEDIA completes successfully.		
10.	User takes wad/page.			
11.			WFS_SRVE_PTR_MEDIATAKEN event generated.	

# 11.3 Multi-Page / Multi-Wad Printing with immediate Media Control

This table illustrates a successful WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command where multiple page / wads are presented (and the *bMediaPresented* Capability flag indicates that the WFS\_EXEE\_PTR\_MEDIAPRESENTED event can be generated). In addition, the previous page/wad must be removed before subsequent pages/wads can be printed.

This table illustrates the command and event flows in a successful print command (i.e. WFS\_CMD\_PTR\_PRINT\_RAW\_FILE, WFS\_CMD\_PTR\_PRINT\_FORM and WFS\_CMD\_PTR\_RAW\_DATA) where the following conditions apply:

- Multiple pages or multiple wads of pages are presented.
- The *bMediaPresented* Capability flag is TRUE (indicates that the WFS\_EXEE\_PTR\_MEDIAPRESENTED event can be generated).
- The dwMediaControl flag in the command data is set to WFS\_PTR\_CTRLEJECT.
- The previous page/wad must be removed before subsequent pages/wads can be presented.

The WFS\_CMD\_PTR\_PRINT\_RAW\_FILE command is used as an example.

Step	End-User	Application	XFS Service Provider	PTR Hardware
1.	User wants a statement printed.			
2.		Win32 used to print statement to a native printer file.		
3.		WFS_CMD_PTR_PRINT RAW_FILE command issued (with dwMediaControl set to WFS_PTR_CTRLEJECT).		
4.			Three wads or pages are required.	
5.				First wad or page presented.
6.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
7.	User takes wad/page.			
8.			WFS_SRVE_PTR_MEDIATAKEN event generated.	
9.				Second wad or page presented.
10.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
11.	User takes wad/page.			
12.			WFS_SRVE_PTR_MEDIATAKEN event generated.	

Step	End-User	Application	XFS Service Provider	PTR Hardware
13.				Final wad or page presented.
14.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
15.		WFS_CMD_PTR_PRINT RAW_FILE completes successfully.		
16.	User takes wad/page.			
17.			WFS_SRVE_PTR_MEDIATAKEN event generated.	

# 11.4 Multi-Page / Multi-Wad Printing with separate Media Control

This table illustrates the command and event flows in a successful print command (i.e. WFS\_CMD\_PTR\_PRINT\_RAW\_FILE, WFS\_CMD\_PTR\_PRINT\_FORM and WFS\_CMD\_PTR\_RAW\_DATA) where the following conditions apply:

- Multiple pages or multiple wads of pages are presented.
- The *bMediaPresented* Capability flag is TRUE (indicates that the WFS EXEE PTR MEDIAPRESENTED event can be generated).
- The dwMediaControl flag in the command data is set to zero.
- The media is presented to the user through a WFS\_CMD\_PTR\_CONTROL\_MEDIA command, with the *lpdwMediaControl* flag set to WFS\_PTR\_CTRLEJECT.
- The previous page/wad must be removed before subsequent pages/wads can be presented.

The WFS CMD PTR PRINT FORM command is used as a specific example.

Step	End-User	Application	XFS Service Provider	PTR Hardware
1.	User wants a statement printed.			
2.		WFS_CMD_PTR_PRINT FORM command issued (with <i>dwMediaControl</i> set to zero).		
3.		WFS_CMD_PTR_PRINT FORM completes successfully.		
4.		WFS_CMD_PTR CONTROL_MEDIA (with lpdwMediaControl set to WFS_PTR_CTRLEJECT).		
5.			Three wads or pages are required.	
6.				First wad or page presented.
7.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
8.	User takes wad/page.			
9.			WFS_SRVE_PTR_MEDIATAKEN event generated.	
10.				Second wad or page presented.
11.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
12.	User takes wad/page.			
13.			WFS_SRVE_PTR_MEDIATAKEN event generated.	

Step	End-User	Application	XFS Service Provider	PTR Hardware
14.				Final wad or page presented.
15.			WFS_EXEE_PTR_MEDIA-PRESENTED event generated.	
16.		WFS_CMD_PTR CONTROL_MEDIA completes successfully.		
17.	User takes wad/page.			
18.			WFS_SRVE_PTR_MEDIATAKEN event generated.	

# 11.5 Printing with immediate Media Control and bMediaPresented == FALSE

This table illustrates the command and event flows in a successful print command (i.e. WFS\_CMD\_PTR\_PRINT\_RAW\_FILE, WFS\_CMD\_PTR\_PRINT\_FORM and WFS\_CMD\_PTR\_RAW\_DATA) where the following conditions apply:

- One or more pages or wads of pages is presented (it is the same flow for one or a number of pages).
- The *bMediaPresented* Capability flag is FALSE (indicates that the WFS EXEE PTR MEDIAPRESENTED event cannot be generated).
- The dwMediaControl flag in the command data is set to WFS\_PTR\_CTRLEJECT.

The WFS CMD PTR PRINT RAW FILE command is used as an example.

Step	End-User	Application	XFS Service Provider	PTR Hardware
1.	User wants a statement printed.			
2.		Win32 used to print statement to a native printer file.		
3.		WFS_CMD_PTR_PRINT RAW_FILE command issued (with dwMediaControl set to WFS_PTR_CTRLEJECT).		
4.			One or more wads/pages are required.	
5.				One or more wad or page presented.
7.		WFS_CMD_PTR_PRINT RAW_FILE completes successfully.		
8.	User takes wads/pages.			
9.			WFS_SRVE_PTR_MEDIATAKEN event generated.
